

Notes:

1. Consecutive participants included in the baseline analysis were eligible at screening and were not later found to be ineligible.
2. Duration of infection - Updated for 5 participants. Clinical sites documented that data would be updated shortly after the baseline analysis data freeze. These changes were made at time of analysis.

ID	New value for duration of hepatitis (yrs)
050015YAZ	30
050086TXR	16
050087KCR	40
170002BHS	20
220080YBU	Unknown

3. Age - Date of birth was collected, so it is included in the documentation, but it is not included in the datasets. Instead, we include age at baseline in years in the Screening information (HBRN_Screen_Info) dataset (see below).
4. The HBRN_Screen_Info dataset includes information about site transfers and after enrollment participant ineligibility along with the screening log information. This information is needed to identify the participants included in the baseline paper and reasons for ineligibility. The last screening record for each consecutive participant who was not a transfer from another clinical site is used to determine screening eligibility.
