Thigh (>40.0 to 52.0cm) ..... 5

- The cuff tubing should be attached to the Mabis Medic-Kit Aneroid sphygmomanometer.
- While palpating the radial pulse (at the wrist), observe sphygmomanometer and inflate the cuff rapidly to 60 mmHg and then slowly inflate in increments of 10 mmHg until the pulse is no longer felt.
- If the pulse is still felt, the cuff pressure should be increased until the pulse disappears. Either the first or the second of these procedures will identify the Observed Pulse Obliteration Pressure.

**ADD 30 mm Hg TO THE OBSERVED PULSE OBLITERATION VALUE TO CALCULATE THE PEAK INFLATION LEVEL**

**WAIT AT LEAST 30 SECONDS BETWEEN MEASUREMENTS.  
AFTER FIRST AND SECOND BLOOD PRESSURE READING, RAISE CHILD'S ARM FOR 15 SECONDS  
(MAKE SURE THE CHILD IS NOT SUPPORTING THE ARM AT ALL.)**

In some patients, the disappearance of sound, i.e. the fifth Korotkoff sound (K5), never occurs and beats can be heard during the entire deflation period. In these circumstances, the fourth Korotkoff sound (K4) should be used to determine the diastolic blood pressure. The fourth Korotkoff sound at the point during deflation where the quality of the sound changes dramatically (e.g. the quality of the beats become muffled.)

e. Second Blood Pressure Reading: \_\_\_\_\_ / \_\_\_\_\_  1) K4  2) K5

f. Third Blood Pressure Reading: \_\_\_\_\_ / \_\_\_\_\_  1) K4  2) K5
