## KEY ROLES

<b>Sponsor Chair / IDE Chair</b>	
<b>Name, degree</b>	Marc Breton
<b>Institution Name</b>	University of Virginia, Center for Diabetes Technology
<b>Protocol Chair/Director</b>	
<b>Name, degree</b>	R. Paul Wadwa, MD
<b>Institution Name</b>	Barbara Davis Center, University of Colorado
<b>JCHR Coordinating Center Director</b>	
<b>Name, degree</b>	Katrina Ruedy, MSPH
<b>Institution Name</b>	Jaeb Center for Health Research
<b>Medical Monitor</b>	
<b>Name, degree</b>	Roy Beck, M.D., Ph.D.
<b>Institution Name</b>	Jaeb Center for Health Research

## PROTOCOL VERSION HISTORY

Version Number	Author(s)	Approver	Effective Date	Revision Description
1.0	R. Paul Wadwa Daniel Cheriñavvsky Katrina Ruedy Roy Beck	R. Paul Wadwa	15NOV2018	Original protocol.
1.1	Jessica Rusnak	Daniel Cheriñavvsky	21NOV2018	
1.2	Sarah Borgman	Katrina Ruedy	28NOV2018	
2.0	Mary Oliveri	Daniel Cheriñavvsky	10DEC2018	Modified study design to include extension phase to the experimental group
2.1	Katrina Ruedy	Daniel Cheriñavvsky	20Dec2018	Clarifications added for consistency throughout protocol
2.2	Jessica Rusnak	Daniel Cheriñavvsky	15Jan2019	Adding inclusion criteria and clarification regarding use of Basal IQ feature; updated incorrect section references
2.3	Jessica Rusnak	Katrina Ruedy	4Feb2019	Removing and adding questionnaires to be completed by participants and parents/guardians
2.4	Katrina Ruedy	Daniel Cheriñavvsky	01Apr2019	Correcting discrepancies in revised questionnaire descriptions and other minor clarifications.
2.5	Katrina Ruedy	Marc Breton	01Jun2019	Corrections to statistical analysis chapter; update of Sponsor name from Daniel Cheriñavvsky to Marc Breton

## TABLE OF CONTENTS

<b>CHAPTER 1: BACKGROUND INFORMATION .....</b>	<b>19</b>
1.1 Introduction.....	19
1.2 Rationale .....	22
1.3 Potential Risks and Benefits of the Investigational Device .....	22
1.3.1 Known Potential Risks.....	22
1.3.1.1 Venipuncture Risks.....	22
1.3.1.2 Fingerstick Risks.....	22
1.3.1.3 Subcutaneous Catheter Risks (CGM) .....	22
1.3.1.4 Risk of Hypoglycemia .....	23
1.3.1.5 Risk of Hyperglycemia .....	23
1.3.1.6 Risk of Device Reuse.....	23
1.3.1.7 Questionnaire .....	24
1.3.1.8 Other Risks .....	24
1.3.2 Known Potential Benefits .....	24
1.3.3 Risk Assessment .....	24
1.4 General Considerations.....	25
<b>CHAPTER 2: STUDY ENROLLMENT AND SCREENING .....</b>	<b>26</b>
2.1 Participant Recruitment and Enrollment.....	26
2.1.1 Informed Consent and Authorization Procedures.....	26
2.2 Participant Inclusion Criteria .....	27
2.3 Participant Exclusion Criteria.....	28
2.4 Screening Procedures.....	28
2.4.1 Data Collection and Testing.....	28
<b>CHAPTER 3: RUN-IN PHASE .....</b>	<b>30</b>
3.1 Run-in Phase Overview .....	30
3.2 Initiation of CGM .....	30
3.3 Initiation of Pump .....	30
3.4 Blood Glucose and Ketone Testing .....	31
3.5 Assessment of Successful Completion of the Run-in Phase.....	32
3.6 Optimization of Insulin Pump Settings.....	33
<b>CHAPTER 4: RANDOMIZATION VISIT .....</b>	<b>34</b>

62	4.1 Randomization Visit .....	34
63	4.1.1 HbA1c .....	34
64	4.1.2 Baseline C-Peptide Assessment .....	34
65	4.1.3 Randomization .....	34
66	4.1.4 Questionnaires.....	35
67	<b>CHAPTER 5: MAIN STUDY PROCEDURES .....</b>	<b>36</b>
68	5.1 Procedures for the CLC Group .....	36
69	5.2 Study System Training.....	36
70	5.2.1 System Initiation .....	37
71	5.2.2 Home Use of the Study System .....	38
72	5.2.3 Study Device Download .....	38
73	5.2.4 1-Week Phone Contact .....	38
74	5.2.5 2-Week Visit (Training Review and Insulin Pump Optimization) .....	38
75	5.3 Procedures for the SC Group.....	39
76	5.3.1 Study Device Data Download.....	39
77	5.3.2 1-Week Phone Contact .....	39
78	5.3.3 2-Week Visit (Training Review and Insulin Pump Optimization) .....	39
79	5.4 Follow-up Visits and Phone Contacts for Both Groups .....	40
80	5.4.1 Follow-up Visits.....	40
81	5.4.1.1 Procedures at Follow-up Visits.....	40
82	5.4.2 Phone Contacts.....	40
83	5.4.3 Data from Study Devices .....	41
84	5.4.4 16-Week Final First Phase Visit .....	41
85	5.5 Early Termination Visit (If Applicable) .....	41
86	5.6 Unscheduled Visits .....	41
87	5.7 Participant Access to Study Device at Study Closure .....	41

## CLINICAL CENTER PRINCIPAL INVESTIGATOR STATEMENT OF COMPLIANCE

Protocol Title: **The International Diabetes Closed Loop (iDCL) trial: Clinical Acceptance of the Artificial Pancreas in Pediatrics- A Study of t:slim X2 with Control-IQ Technology**

Protocol Version/Date: v2.5 / 24MAY2019

I have read the protocol specified above. In my formal capacity as a Clinical Center Principal Investigator, my duties include ensuring the safety of the study participants enrolled under my supervision and providing the Jaeb Center for Health Research, with complete and timely information, as outlined in the protocol. It is understood that all information pertaining to the study will be held strictly confidential and that this confidentiality requirement applies to all study staff at this clinical center.

This trial will be carried out in accordance with ICH E6 Good Clinical Practice (GCP) and as required by the following: United States (US) Code of Federal Regulations (CFR) applicable to clinical studies (45 CFR Part 46, 21 CFR Part 50, 21 CFR Part 56, 21 CFR Part 312, and/or 21 CFR Part 812).

As the Principal Investigator, I will assure that no deviation from, or changes to the protocol will take place without prior agreement from the sponsor and documented approval from the Institutional Review Board (IRB), or other approved Ethics Committee, except where necessary to eliminate an immediate hazard(s) to the trial participants.

All key personnel (all individuals responsible for the design and conduct of this trial) have completed Human Participants Protection Training and Good Clinical Practice Training. Further, I agree to ensure that all staff members involved in the conduct of this study are informed about their obligations in meeting the above commitments.

Investigator's Signature \_\_\_\_\_ Date: \_\_\_\_ / \_\_\_\_ / \_\_\_\_

## PROTOCOL SUMMARY

PARTICIPANT AREA	DESCRIPTION
<b>Title</b>	The International Diabetes Closed Loop (iDCL) trial: Clinical Acceptance of the Artificial Pancreas in Pediatrics- A study of t:slim X2 with Control-IQ Technology
<b>Précis</b>	A randomized controlled trial of at-home closed loop system vs. standard of care (defined as either sensor-augmented pump or any kind of low predictive low blood glucose suspend [PLGS; LGS] if participant is currently using) in youth age 6 to 13 years old.
<b>Investigational Device</b>	t:slim X2 with Control-IQ and Dexcom G6 system
<b>Objectives</b>	The objective of the study is to assess efficacy and safety of a closed loop control (CLC) system (t:slim X2 with Control-IQ Technology) in a randomized controlled trial with partial crossover.
<b>Study Design</b>	First phase a 16-week parallel group randomized clinical trial with 3:1 randomization to intervention with the closed loop system vs. standard of care (SC); followed by a 12-week period where the Standard of Care (SC) group will transition to use CLC and the experimental arm will extend the use of CLC for the same period
<b>Number of Clinical Centers</b>	Up to 4 US clinical centers
<b>Endpoint</b>	The primary outcome for the first phase is time in target range 70-180 mg/dL measured by CGM in CLC group vs. SC group over 16 weeks The primary outcome for the extension phase is improving time in range 70-180 mg/dL by CGM when SC (control group) transitions to t:slim X2 with Control-IQ compared with the same group during the Main Phase.
<b>Population</b>	<p><b>Key Inclusion Criteria</b></p> <ul style="list-style-type: none"> <li>• Type 1 Diabetes</li> <li>• Ages <math>\geq 6</math> and <math>\leq 13</math> years old</li> </ul> <p><b>Key Exclusion Criteria</b></p> <ul style="list-style-type: none"> <li>• Use of any non-insulin glucose-lowering agents except metformin</li> <li>• Actively using any other closed-loop system</li> </ul>
<b>Sample Size</b>	First phase: Up to 150 screened participants with the goal of randomizing 100 participants in this 16-week randomized trial. Extension phase will consist of a partial crossover: All randomized participants will participate in an extension phase for another 12 weeks (total 28 weeks). The SC group (control group) will crossover to use Tandem t:slim X2 with Control-IQ for 12 weeks. The experimental arm will continue on the Control-IQ for 12 weeks.
<b>Treatment Groups</b>	<ul style="list-style-type: none"> <li>• Intervention Group: t:slim X2 with Control-IQ Technology and Study CGM.</li> <li>• Control Group: Standard of care (SC) (defined as either sensor-augmented pump or any kind of low or predictive low blood glucose suspend [PLGS; LGS] if participant is currently using), and study CGM</li> <li>• All participants will be offered to extend the study for 12 weeks and the SC group will use the t:slim X2 with Control-IQ System after the first 16-week phase</li> </ul>
<b>Participant Duration</b>	16-20 weeks (depending on duration of run-in phase) plus ~12-week extension phase

PARTICIPANT AREA	DESCRIPTION
Protocol Overview/Synopsis	After consent is signed, eligibility will be assessed. Eligible participants not currently using an insulin pump and Dexcom G4, G5 or Dexcom G6 CGM with minimum data requirements will initiate a run-in phase of 2 to 4 weeks that will be customized based on whether the participant is already a pump or CGM user. Participants who skip or successfully complete the run-in will be randomly assigned 3:1 to the use of closed-loop control (CLC group) system using Tandem t:slim X2 with Control-IQ Technology vs SC for 16 weeks. All participants will be provided the option of using t:slim X2 with Control-IQ system in a 12 week Extension Phase. [Figure 1]

## Chapter 1: Background Information

### 265 1.1 Introduction

266 The Tandem X2 insulin pump with Control-IQ Technology is a third-generation closed-loop  
 267 control (CLC) system retaining the same control algorithm that was initially tested by UVA's DiAs  
 268 system and then implemented in the inControl system (TypeZero Technologies, Inc.). DiAs is  
 269 described in 13 IDEs (see IDEs 1-12 and 14 in the list below) and inControl is described on the  
 270 rest of IDEs mentioned below (i.e. in IDEs G160097, G160181, G150240, G140169/S010). For  
 271 complete algorithmic and clinical background, we refer to these IDEs and to a number of scientific  
 272 publications that describe glycemic control outcomes and clinical impressions from the use of  
 273 these systems (see list of 25 peer-reviewed papers and scientific presentations under Bibliography).  
 274 Overall, this control algorithm has been implemented in two mobile platforms (DiAs and  
 275 inControl) and has been tested in 30 clinical trials by 450 adults and children with type 1 diabetes  
 276 for over 350,000 hours of use to date in the U.S. and overseas.

277 As described in the Background, this project is a result from a sequence of clinical trials that have  
 278 tested extensively the control system and in several centers in the U.S. and overseas. The following  
 279 21 IDEs reflect this progress:

- 280 1. IDE #G110095: Feasibility study of closed loop control in type 1 diabetes using heart rate  
 281 monitoring as an exercise marker, approved 10/08/2011;
- 282 2. IDE #G120032: Early feasibility (pilot) study of outpatient control-to-range; 3/2/2012;
- 283 3. IDE #G120210: Early feasibility study 2 of outpatient control-to-range; 10/12/2012;
- 284 4. IDE #G130118: DiAs control-to-range nocturnal closed-loop camp study; 6/19/2013;
- 285 5. IDE #G130121: Optimizing closed-loop control of type 1 diabetes mellitus in adolescents;  
 286 6/19/2013;
- 287 6. IDE# G130142: Closed loop control in adolescents using heart rate as exercise indicator;  
 288 7/16/13;
- 289 7. IDE #G130143: Early feasibility study of adaptive advisory/automated (AAA) control of  
 290 type 1 diabetes; 7/19/2013;
- 291 8. IDE #G140066: Full day and night closed-loop with DiAs platform; 5/9/14.
- 292 9. IDE #G140068: Unified Safety System (USS) Virginia Closed Loop versus sensor

312 in Youth with Type 1 Diabetes: The AP Ski Camp Continued”; 11/21/17
- 313 19. IDE#G150240/S008: A long-term home use study, enrolling 18-70 years old T1D  
314 participants since January 2018; it is anticipated that this study will be completed April 2019.
- 315 20. IDE#G170255: A pilot study of 5 adult subjects completed in December 2017.
- 316 21. IDE#G170267: Three 48-hour winter ski camps trial T1D participants; one site enrolled 13-  
317 18 years old participants in January 2018. The other two sites enrolled participants aged 6-12  
318 years old. At the conclusion of these ski camps, subjects continued with the study device for  
319 72 hours use at home (March & April 2018).

320 In the G170255 pilot study (mean age 52.8 yrs; 3F/2M, mean A1c 6.5%), the system was  
321 challenged with a variety of scenarios including: Pump disconnection, CGM sensor removal  
322 without stopping session, CGM sensor change, Basal Rate change, Cartridge Change, Extended  
323 Bolus, Calibration at non-ideal conditions, Stopping Control-IQ, Reset Sleep Time, Restaurant  
324 Meals and Exercise (treadmill/walk). The study demonstrated excellent connectivity with 98%  
325 time in closed-loop control and 94%-time CGM is available during 196 hours of use. [28]

326 The results of the home portion of the IDE#G170267/ski camp trial (Table 5) were as follow: The  
327 Control-IQ significantly improved time in target range 70-180 mg/dL ( $71.0\pm 6.6$  vs.  $52.8\pm 13.5\%$ ;  
328  $p=0.001$ ) and mean sensor glucose ( $153.6\pm 13.5$  vs.  $180.2\pm 23.1$  mg/dL;  $p=0.003$ ) without  
329 increasing hypoglycemia time  $<70$  mg/dL ( $1.7$  [1.3-2.1] vs.  $0.9$  [0.3-2.7]%; ns). The HCL system  
330 was active for 94.4% of the study period. Subjects reported that use of the system was associated  
331 with less time thinking about diabetes, decreased worry about blood sugars, and decreased burden  
332 in managing diabetes. [33]

333 No AE or SAE happened during these trials related to the equipment used.

334

METRIC (COMPUTED DURING CLOSED-LOOP USE)	OVERALL	DAYTIME	NIGHTTIME
Mean glucose (mg/dL)	129	135	121
Coefficient of variation (median)	27%	27%	21%
% below 54 mg/dL (median)	0.7%	0.0%	0.0%
% below 60 mg/dL (median)	1.1%	2.0%	0.0%
% below 70 mg/dL (median)	2.9%	4.1%	1.0%
<b>Percent in range 70-180 mg/dL (mean)</b>	<b>87%</b>	<b>82%</b>	<b>94%</b>
% above 180 mg/dL (median)	5%	8%	6%
% above 250 mg/dL (median)	0%	0%	0%
% above 300 mg/dL (median)	0%	0%	0%

**Table 5. Glycemic Outcomes Measured by CGM: Ski camp and home use trial**

337

### 338 Closed-Loop Control System

339 The Closed-Loop Control System contained in t-slim X2 with Control-IQ Technology is described  
340 in Master File MAF-2032/A008. Control-IQ Technology is derived from inControl previously  
341 described in IDE# G160097, G160181, G150240 and G140169/S010. The CLC is an “artificial  
342 pancreas” (AP) application that uses advanced closed loop control algorithms to automatically  
343 manage blood glucose levels for people with Type 1 Diabetes. The system modulates insulin to  
344 keep blood glucose in a targeted range. The system components include the t:slim X2 with  
345 Control-IQ Technology and the Dexcom CGM G6.

346  
347 **Figure 4. t:slim X2 with Control-IQ and Dexcom G6 system**

348 **1.2 Rationale**

349 The objective of this randomized clinical trial is to assess the efficacy and safety of the Control-  
350 IQ closed loop system over a 16-week period compared with standard of care. In addition, the data  
351 from this trial may be used for subsequent PMA application for this system.

352 The 12-week extension phase will allow for additional exposure time to the Tandem t:slim X2 with Control-  
353 IQ Technology and evaluation of the SC arm when crossover to use Control IQ for 12-week period.

354 **1.3 Potential Risks and Benefits of the Investigational Device**

355 Risks and Benefits are detailed below. Loss of confidentiality is a potential risk; however, data are  
356 handled to minimize this risk. Hypoglycemia, hyperglycemia and ketone formation are always a  
357 risk in participants with type 1 diabetes and participants will be monitored for these events.

358 **1.3.1 Known Potential Risks**

359 **1.3.1.1 Venipuncture Risks**

360 A hollow needle/plastic tube will be placed in the arm for taking blood samples. Blood draws can  
361 cause some common reactions like pain, bruising, or redness at the sampling site. Less common  
362 reactions include bleeding from the sampling site, formation of a small blood clot or swelling of  
363 the vein and surrounding tissues, and fainting.

364 **1.3.1.2 Fingertick Risks**

365 About 1 drop of blood will be removed by fingertick for measuring blood sugars and sometimes  
366 HbA1c or other tests. This is a standard method used to obtain blood for routine hospital laboratory  
367 tests. Pain is common at the time of lancing. In about 1 in 10 cases, a small amount of bleeding  
368 under the skin will produce a bruise. A small scar may persist for several weeks. The risk of local  
369 infection is less than 1 in 1000. This should not be a significant contributor to risks in this study  
370 as fingerticks are part of the usual care for people with diabetes.

371 **1.3.1.3 Subcutaneous Catheter Risks (CGM)**

372 Participants using the CGM will be at low risk for developing a local skin infection at the site of  
373 the sensor needle placement. If a catheter is left under the skin for more than 24 hours, it is possible

374 to get an infection where it goes into the skin, with swelling, redness and pain. There may be  
375 bleeding where the catheter is put in and bleeding under the skin causes a bruise (1 in 10 risk).

376 Study staff should verbally alert the participant that on rare occasions, the CGM may break and  
377 leave a small portion of the sensor under the skin that may cause redness, swelling or pain at the  
378 insertion site. The participant should be further instructed to notify the study coordinator  
379 immediately if this occurs.

#### 380 **1.3.1.4 Risk of Hypoglycemia**

381 As with any person having type 1 diabetes and using insulin, there is always a risk of having a low  
382 blood sugar (hypoglycemia). The frequency of hypoglycemia should be no more and possibly less  
383 than it would be as part of daily living. Symptoms of hypoglycemia can include sweating,  
384 jitteriness, and not feeling well. Just as at home, there is the possibility of fainting or seizures  
385 (convulsions) and that for a few days the participant may not be as aware of symptoms of  
386 hypoglycemia. A CGM functioning poorly and significantly over-reading glucose values could  
387 lead to inappropriate insulin delivery.

#### 388 **1.3.1.5 Risk of Hyperglycemia**

389 Hyperglycemia and ketonemia could occur if insulin delivery is attenuated or suspended for an  
390 extended period or if the pump or infusion set is not working properly. A CGM functioning poorly  
391 and significantly under-reading glucose values could lead to inappropriate suspension of insulin  
392 delivery.

#### 393 **1.3.1.6 Risk of Device Reuse**

394 The study CGM system is labeled for single use only. The sensor (the component of the system  
395 that enters the skin) will be single use only. The receiver, if used, is a hand-held device. The  
396 transmitter and receiver may be reused during the study after cleaning the device using a hospital-  
397 approved cleaning procedure. The transmitter is attached to the sensor but does not enter the skin.  
398 Participants will be informed that FDA or relevant national authorities have approved these devices  
399 for single use and that by using them among multiple patients, bloodborne pathogens (i.e. Hepatitis  
400 B) may be spread through the use of multiple users.

401 The study insulin pump is labeled for single-patient use. During the study, this device may be  
402 reused after cleaning adhering to a hospital-approved cleaning procedure. All infusion set  
403 equipment will be single patient use only (infusion set insertion kits, tubing, cartridges etc.)  
404 Participants will be informed that FDA or relevant national authorities typically approve the insulin  
405 pump device for single use and that by using them among multiple patients, bloodborne pathogens  
406 (i.e. Hepatitis B) may be spread through the use of multiple users.

407 The study blood glucose meter and blood ketone meter are labeled for single-patient use.  
408 During the study, only one person can use each device as there are rare risks that bloodborne  
409 pathogens (i.e. Hepatitis B) may be spread through the use of multiple users.

410 **1.3.1.7 Questionnaire**

411 As part of the study, participants (parent and child) will complete questionnaires which include  
412 questions about their private attitudes, feelings and behavior related to the investigational  
413 equipment as well as managing diabetes. It is possible that some people may find these  
414 questionnaires to be mildly upsetting. Similar questionnaires have been used in previous research  
415 and these types of reactions have been uncommon.

416 **1.3.1.8 Other Risks**

417 Some participants may develop skin irritation or allergic reactions to the adhesives used to secure  
418 the CGM, or to secure the insulin infusion sets for the continuous subcutaneous insulin infusion.  
419 If these reactions occur, different adhesives or “under-taping” (such as with IV 3000, Tegaderm,  
420 etc.) will be tried, sites will be rotated frequently, and a mild topical steroid cream or other  
421 medication may be required.

422 Whenever the skin is broken there is the possibility of an infection. The CGM and pump infusion  
423 sites are inserted under the skin. It is possible that any part that is inserted under the skin may  
424 cause an infection. These occur very infrequently, but, if an infection was to occur, oral and/or  
425 topical antibiotics can be used. The risk of skin problems could be greater if you use a sensor for  
426 longer than it is supposed to be used. Therefore, participants (and parents) will be carefully  
427 instructed about proper use of the sensor.

428 Data downloaded from the CGM, pump, and the home glucose and ketone meter will be collected  
429 for the study as measures of diabetes self-management behaviors. Some people  
430 may be uncomfortable with the researchers' having such detailed information about their daily  
431 diabetes habits.

432 **1.3.2 Known Potential Benefits**

433 One purpose of this research is to reduce the frequency of hypoglycemia and severe hypoglycemic  
434 events. Hypoglycemia is the number one fear of many individuals and families with someone who  
435 has type 1 diabetes and this fear often prevents optimal glycemic control.

436 It is expected that this protocol will yield increased knowledge about using an automated  
437 closed-loop system to control the glucose level and is intended to develop data to support a future  
438 PMA-application. The individual participant may not benefit from study participation.

439 **1.3.3 Risk Assessment**

440 Based on the facts that (1) children and adolescents with diabetes experience mild hypoglycemia  
441 and hyperglycemia frequently as a consequence of the disease and its management, (2) the study  
442 intervention involves periodic automated insulin dosing that may reduce the likelihood of  
443 hypoglycemia, and periodic automated attenuation of insulin delivery that may reduce the  
444 likelihood of hyperglycemia, (3) if any, hypo and/or hyperglycemia occur, mitigations are in place,  
445 and have been tested in prior studies using the investigational device system in the home setting,  
446 that limit the likelihood of excessive insulin dosing or prolonged withdrawal of insulin, and (4)  
447 rapid reversal of hypoglycemia and hyperglycemia can be achieved, it is the assessment of the  
448 investigators that this protocol falls under DHHS 46.405 which is a minor increase over minimal

449 risk. In addition, it is the belief of the investigators that this study also presents prospect of direct  
450 benefit to the participants and general benefit to others with diabetes.

#### 451 **1.4 General Considerations**

452 The study is being conducted in compliance with the policies described in the study policies  
453 document, with the ethical principles that have their origin in the Declaration of Helsinki, with the  
454 protocol described herein, and with the standards of Good Clinical Practice (GCP).

455 Whenever possible, data will be directly collected in electronic case report forms, which will be  
456 considered the source data.

457 There is no restriction on the number of participants to be enrolled by each clinical center toward  
458 the overall recruitment goal.

459 The protocol is considered a significant risk device study, due to the fact that the closed loop  
460 system is experimental. Therefore, an investigational device exemption (IDE) from the U.S. Food  
461 and Drug Administration (FDA) is required to conduct the study.

462

## Chapter 2: Study Enrollment and Screening

### 463 2.1 Participant Recruitment and Enrollment

464 Enrollment will proceed with the goal of having 100 participants randomized for the first 16-week  
465 phase of this trial. A maximum of 150 individuals may be enrolled into screening for the study in  
466 order to achieve this goal considering an approximately 30% withdrawal and screen failure rate.

467 For the extension phase, all 100 participants that were randomized and completed the main study  
468 will complete the 12-week extension phase. The participants randomized to SC in the main study  
469 will crossover to use t:slim x2 with Control IQ. The interventional arm in the main study will  
470 continue using the Control IQ system for 12 additional weeks.

471 Study participants will be recruited from up to 4 clinical centers in the United States without regard  
472 to gender, race, or ethnicity. There is no restriction on the number of participants to be enrolled  
473 by each clinical center toward the overall recruitment goal.

474 The study team will make every effort to have the following minimum numbers of participants  
475 complete the trial in the specified subgroups at the time of enrollment:

- 476 • At least one-third of participants with HbA1c  $\geq 8.0\%$  and one-third of participants with HbA1c  
477  $< 7.9\%$
- 478 • At least one-third of participants in the age range 6-10 and one-third of participants 11-13 years  
479 old
- 480 • At least 20% of participants who are on multiple daily injections (MDI) rather than pump
- 481 • At least 20% of participants who are CGM-naïve (defined as not using a CGM in the prior 3  
482 months)

#### 483 2.1.1 Informed Consent and Authorization Procedures

484 Potential eligibility may be assessed as part of a routine-care examination. Before completing any  
485 procedures or collecting any data that are not part of usual care, written informed consent and child  
486 assent will be obtained.

487 A parent/legal guardian (referred to subsequently as “parent”) will be provided with the Informed  
488 Consent Form to read and will be given the opportunity to ask questions. Potential participants  
489 meeting the IRB’s minimum age of assent will be given a Child Assent Form to read and discuss  
490 with his/her parents and study personnel. If the parent and child agree to participate, the Informed  
491 Consent Form and Child Assent Form (if applicable) will be signed. A copy of the consent form  
492 will be provided to the participant and his/her parent and another copy will be added to the  
493 participant’s study record.

494 As part of the informed consent process, each participant and/or parent/legal guardian will be asked  
495 to sign an authorization for release of personal information. The investigator, or his or her  
496 designee, will review the study-specific information that will be collected and to whom that

497 information will be disclosed. After speaking with the participant, questions will be answered  
498 about the details regarding authorization.

499 A participant is considered enrolled when the informed consent form and child assent (if  
500 applicable) has been signed.

## 501 **2.2 Participant Inclusion Criteria**

502 Individuals must meet all of the following inclusion criteria in order to be eligible to participate in  
503 the study.

504 1. Clinical diagnosis, based on investigator assessment, of type 1 diabetes for at least one year  
505 and using insulin for at least 6 months

506 2. Familiarity and use of a carbohydrate ratio for meal boluses.

507 3. Age  $\geq 6$  and  $\leq 13$  years old

508 4. Weight  $\geq 25$  kg and  $\leq 140$  kg

509 5. For females, not currently known to be pregnant

510 *If female and sexually active, must agree to use a form of contraception to prevent pregnancy*  
511 *while a participant in the study. A negative serum or urine pregnancy test will be required for*  
512 *all females of child-bearing potential. Participants who become pregnant will be discontinued*  
513 *from the study. Also, participants who during the study develop and express the intention to*  
514 *become pregnant within the timespan of the study will be discontinued.*

515 6. Living with one or more parent/legal guardian knowledgeable about emergency procedures for  
516 severe hypoglycemia and able to contact emergency services and study staff.

517 7. Willingness to suspend use of any personal closed loop system that they use at home for the  
518 duration of the clinical trial once the study CGM is in use

519 8. Investigator has confidence that the participant can successfully operate all study devices and  
520 is capable of adhering to the protocol

521 9. Willingness to switch to lispro (Humalog) or aspart (Novolog) if not using already, and to use  
522 no other insulin besides lispro (Humalog) or aspart (Novolog) during the study for participants  
523 using the t:slim X2. This includes:

524 ○ Participants randomized to Control IQ

525 ○ Participants on the SC group on MDI treatment that will be provided a Tandem  
526 pump to switch to CSII

527 ○ Participates that are already in CSII randomized to SC during the extension phase  
528 when transition to Control IQ

529 10. Total daily insulin dose (TDD) at least 10 U/day

530 11. Willingness not to start any new non-insulin glucose-lowering agent during the course of the  
531 trial (see section 2.3)

532 12. Participant and parent(s)/guardian(s) willingness to participate in all training sessions as  
533 directed by study staff.

### 534 **2.3 Participant Exclusion Criteria**

535 Individuals meeting any of the following exclusion criteria at baseline will be excluded from study  
536 participation.

- 537 1. Concurrent use of any non-insulin glucose-lowering agent other than metformin (including  
538 GLP-1 agonists, Symlin, DPP-4 inhibitors, SGLT-2 inhibitors, sulfonylureas).
- 539 2. Hemophilia or any other bleeding disorder
- 540 3. A condition, which in the opinion of the investigator or designee, would put the participant or  
541 study at risk (specified on the study procedure manual)
- 542 4. Participation in another pharmaceutical or device trial at the time of enrollment or during the  
543 study
- 544 5. Employed by, or having immediate family members employed by Tandem Diabetes Care, Inc.,  
545 or having a direct supervisor at place of employment who is also directly involved in  
546 conducting the clinical trial (as a study investigator, coordinator, etc.); or having a first-degree  
547 relative who is directly involved in conducting the clinical trial

### 548 **2.4 Screening Procedures**

549 After informed consent has been signed, a potential participant will be evaluated for study  
550 eligibility through the elicitation of a medical history, performance of a physical examination  
551 by study personnel and local laboratory testing if needed to screen for exclusionary medical  
552 conditions.

553 Individuals who do not initially meet study eligibility requirements may be rescreened at a later  
554 date per investigator discretion.

#### 555 **2.4.1 Data Collection and Testing**

556 A standard physical exam (including vital signs and height and weight measurements) will be  
557 performed by the study investigator or designee (a physician, research physician, resident, fellow,  
558 nurse practitioner or a physician assistant).

559 The following procedures will be performed/data collected/eligibility criteria checked and  
560 documented:

- 561 • Inclusion and exclusion criteria assessed
- 562 • Demographics (date of birth, sex, race and ethnicity)
- 563 • Contact information (retained at the clinical center and not entered into study database)
- 564 • Medical history
- 565 • Concomitant medications

- 566 • Physical examination to include:
- 567 • Weight, height
- 568 • Vital signs including measurement of blood pressure and pulse
- 569 • Comprehensive Metabolic Panel to assess kidney and liver functioning
- 570 Blood draw for:
- 571 • HbA1c level measured using the DCA Vantage or comparable point of care device or local lab
- 572 ○ Measurement performed as part of usual clinical care prior to obtaining informed consent
- 573 ○ for participation in the trial may be used
- 574 ○ Measurement must be made within two weeks prior to enrollment
- 575 ○ Sample to be sent to a central lab
- 576 • Urine or serum pregnancy test for all women of child-bearing potential and sexually active.
- 577 Screening procedures will last approximately 1-2 hours.

## Chapter 3: Run-In Phase

### 579 3.1 Run-in Phase Overview

580 This phase may begin immediately after enrollment is complete or may be deferred for a maximum  
581 of 28 days. The purpose of this run-in phase is to 1) assess compliance with study procedures, 2)  
582 to introduce the study CGM to study participants without current use of a CGM and 3) to introduce  
583 an insulin pump to participants who have not previously used an insulin pump.

584 Participants who currently use an insulin pump and a Dexcom G4, G5 or G6 with CGM data  
585 captured on at least 11 out of the previous 14 days prior to the time of enrollment can skip the run-  
586 in phase. If a participant is using a pump with a Low Glucose Suspend (LGS) feature, they will be  
587 allowed to continue using this feature. Participants who do not currently use a Dexcom G4, G5, or  
588 G6 CGM will be required to participate in the CGM run-in phase. Participants currently using a  
589 Dexcom G4, G5, or G6 CGM with CGM readings captured on fewer than 11 out of the previous  
590 14 days prior to time of enrollment will be required to participate in the CGM run-in phase. During  
591 the CGM run-in phase, participants will use the study CGM for a minimum of 11 days with a goal  
592 of at least 14 days.

593 All participants and their parent(s) will receive training on the study CGM as detailed below. This  
594 will be an unblinded use of the study CGM.

595 Additionally, MDI and study pump naïve participants will participate in a pump run-in phase that  
596 will run 2 to 6 weeks before randomization is assigned. If both pump run-in phase and CGM run-  
597 in phase are indicated, they will run concurrently. Training is detailed below.

598

### 599 3.2 Initiation of CGM

600 The participant will be provided with sensors and instructed to use the study CGM on a daily basis.  
601 Training will be provided to participants not experienced with CGM use as to how to use the CGM  
602 in real-time to make management decisions and how to review the data after an upload for  
603 retrospective review. Participants using a personal CGM prior to the study will discontinue the  
604 personal CGM beginning in this period.

605 The participant will be observed placing the sensor. The study CGM user's guide will be provided  
606 for the participant to take home.

### 607 3.3 Initiation of Pump

608 Pump-naïve participants will use the study insulin pump and CGM for up to 4 weeks before  
609 randomization is assigned.

610 Participants who are pump-naïve will be provided with a study pump similar to the pump used  
611 with the closed-loop system, but with the closed-loop control feature either absent or deactivated  
612 and will be instructed to use the pump on a daily basis. An initial basal insulin profile will be

613 customized on a per-participant basis. Total daily insulin dose will be reduced by approximately  
614 20% as a general rule, with a recommended method outlined in a separate procedures' manual.  
615 Further adjustments to total daily dose (TDD) and intraday basal rate profile may be made during  
616 the course of the run-in period that can be concomitant with the CGM run-in phase.

617 Participants and parent(s) will complete training on the study pump as detailed below.

- 618 • The participant will be fully instructed on the study insulin pump. A qualified system trainer  
619 will conduct the training and in particular discuss differences from their home pump in  
620 important aspects such as calculation of insulin on board (IOB) and correction boluses.
- 621 • The study pump will have the Basal-IQ feature, and participants will be able to use this feature  
622 at investigator discretion.

623 Additional topics are not limited to but may include: infusion site initiation, cartridge/priming  
624 procedures, setting up the pump, charging the pump, navigation through menus, bolus  
625 procedures including stopping a bolus, etc.

- 626 • For pump-naïve participants, the study team will assist the participant in study pump infusion  
627 site initiation and will start the participant on the study pump. The study pump will be  
628 programmed with the participant's insulin requirements.
- 629 • The participant will be supervised with the study pump during at least one meal or snack bolus  
630 to ensure participant understanding of the pump features.
- 631 • The participant will be encouraged to review the literature provided with the pump and infusion  
632 sets after the training is completed.

633

634 Note: For the extension phase, participants in the control group will be trained on the use of the  
635 Control IQ system. Follow up phone contacts and in-clinic visits are described in Table 3.

636

### 637 **3.4 Blood Glucose and Ketone Testing**

638 Participants will receive supplies for blood glucose and ketone testing.

- 639 • Blood glucose testing
  - 640 ○ Participants will be provided with a study blood glucose meter, test strips, and standard  
641 control solution to perform quality control (QC) testing at home per manufacturer guidelines.
  - 642 ○ All study blood glucose meters will be QC tested with control solution if available during  
643 all office visits. A tested meter will not be used in a study if it does not read within the target  
644 range at each concentration per manufacturer labeling. The participant will be instructed to  
645 contact study staff for a replacement of the meter, test strips, and control solution if a meter  
646 fails QC testing at home.

- 647 ○ Participants will be reminded to use the study blood glucose meter for all fingerstick BGs
- 648 during the study.
- 649 ○ Participants will be given guidelines for treatment of low or high blood glucose.
- 650 ● Blood ketone testing
  - 651 ○ Participants will be provided with a study blood ketone meter, test strips, and standard
  - 652 control solution to perform QC testing at home per manufacturer guidelines.
  - 653 ○ All study blood ketone meters will be QC tested with control solution if available during
  - 654 all office visits. A tested meter will not be used in a study if it does not read within the target
  - 655 range at each concentration per manufacturer labeling. The participant will be instructed to
  - 656 contact study staff for a replacement of the meter, test strips, and control solution if a meter
  - 657 fails QC testing at home.
  - 658 ○ Participants will be instructed to perform blood ketone testing as described in section 7.1.6.
  - 659 ○ Participants will be given guidelines for treatment of elevated blood ketones
  - 660 ● Participants will be required to have a home glucagon emergency kit. Participants who
  - 661 currently do not have one will be given a prescription for the glucagon emergency kit.

### 662 **3.5 Assessment of Successful Completion of the Run-in Phase**

663 Enrolled participants will return approximately 14 days after the initiation of the run-in phase  
 664 to assess progress or successful completion of the phase. If needed, one or more interim visits or  
 665 phone contacts may occur to assist the participant with any system use issues. Visit procedures  
 666 will include the following:

- 667 ● Assessment of compliance with the use of either or both CGM and/or study pump (if
- 668 applicable)
- 669 ● Assessment of compliance with the use of:
  - 670 ○ CGM,
  - 671 ○ study pump,
  - 672 ○ CGM and study pump
- 673 ● Assessment of skin reaction in areas where a CGM sensor was worn
- 674 ● Assessment of eligibility to continue to the randomized control trial (RCT) phase of the study

675 The appropriate study equipment will be downloaded and reviewed after the first 2 weeks of the  
 676 run-in phase have been completed; participants will be evaluated for compliance and progress. If  
 677 that run-in phase occurred without any major safety issues, participants who are completing only  
 678 the CGM run-in can be randomized. Those completing study pump and CGM may continue the  
 679 run-in phase for another 2-4 weeks at PI discretion. In addition, MDI or study-pump naïve  
 680 participants will be contacted by study staff within approximately 24hrs, 72hrs, and 1 week after  
 681 pump initiation to answer any questions related to device use prior to the 2-week visit. All  
 682 participants may have unlimited contact with the study team as needed.

683 To enter the randomized trial from the run-in phase, participants must have obtained CGM  
684 readings on at least 11 out of the previous 14 days of the run-in phase (if applicable) and pump-  
685 naïve patients must have successfully used the study pump each day (if applicable). If a participant  
686 fails to meet either or both of these criteria, or if it is determined that the participant will benefit  
687 from additional time with equipment training, then the run-in period may be extended at the  
688 discretion of the investigator. One or two additional periods may occur, each a minimum of 11  
689 days with a goal of at least 14 days, with another clinic visit to assess results after each period  
690 using the same criteria as above. The run-in duration will therefore vary from approximately 2 to 6  
691 weeks, depending on the participant. Additional visits and phone contacts for further training are  
692 at investigator discretion.

693 An assessment of CGM and pump knowledge will be made and the participant must demonstrate  
694 sufficient competency to proceed to the RCT. The trainer and participant will review the individual  
695 items listed on the pump training checklist to ensure competency.

696 Participants who are unable to meet the CGM or study pump compliance requirements and those  
697 who no longer meet all of the inclusion and exclusion criteria will be withdrawn from the study.

698 If the participant is eligible to continue in the study, study staff will follow the procedure for insulin  
699 pump optimization described below in section 3.6.

### 700 **3.6 Optimization of Insulin Pump Settings**

- 701 • Data-driven optimization of pump settings will occur at the following times:
- 702 • For the first phase: Prior to Randomization:
  - 703 ○ At the Run-in Review Visit
- 704 • Following Randomization visit and initiation of Extension Phase:
  - 705 ○ If needed at the criteria of the physician at each clinical center, optimization may be done
  - 706 by phone contacts or in clinic visits.
  - 707 ○ If the study participant contacts the study physician due to concerns about their pump
  - 708 settings due to recurring hypo- or hyperglycemia.

709 Data will be obtained from CGM and/or pump downloads at the visit. Adjustments to pump  
710 settings (basal rates, correction factor, insulin-to-carbohydrate ratio, etc.) will be made in response  
711 to major trends observed in the CGM data, with flexibility for clinicians to adhere to guidelines  
712 and practices established at each individual practice rather than a fixed set of heuristics for all  
713 clinical centers.

714

## Chapter 4: Randomization Visit

### 715 4.1 Randomization Visit

716 The visit may occur on the same day as the Screening or Run-in Review Visit, or on a subsequent  
717 day. If deferred, the randomization visit should occur no more than 14 days after screening (if Run-  
718 in skipped) or successful completion of the run-in phase.

719 A urine pregnancy test will be repeated for all females of child-bearing potential if this visit is not  
720 on the same day as the Screening Visit.

#### 721 4.1.1 HbA1c

722 HbA1c will be measured using DCA Vantage or similar point-of-care (POC) device or local lab if  
723 this visit is not on the same day as the Screening Visit. A blood sample also will be drawn to send  
724 to the central laboratory for baseline HbA1c determination to be used in outcome analyses.

#### 725 4.1.2 Baseline C-Peptide Assessment

726 A blood sample will be drawn to send to the central laboratory for a random, non-fasting C-peptide  
727 determination to characterize baseline residual insulin production. In conjunction, blood glucose  
728 may be measured using a blood glucose meter or a blood sample may be drawn to send to the  
729 central laboratory for a blood glucose assessment.

#### 730 4.1.3 Randomization

731 Eligible participants will be randomly assigned to one of two treatment groups in a 3:1 ratio:

- 732 1. Control-IQ Closed-Loop Control (CLC) Group
- 733 2. Standard of Care (SC) Group

734 The participant's randomization group assignment is determined by completing a Randomization  
735 Visit case report form on the study website. The randomization list will use a permuted block  
736 design, stratified by clinical center.

737 *The participant will be included in the data analysis regardless of whether or not the protocol for*  
738 *the assigned randomization group is followed. Thus, the investigator must not randomize a*  
739 *participant until he/she is convinced that the participant/parent will accept assignment to either*  
740 *of the two groups.*

741 *It was decided that it was more important to stratify randomization by clinical center than by*  
742 *factors such as baseline time in range, HbA1c, or device use since these factors will be easier to*  
743 *adjust for in analysis than will clinical center in view of the relatively small number at each clinical*  
744 *center.*

745 **4.1.4 Questionnaires**

746 Participants will complete a set of baseline questionnaires, described in section 8.2 adapted for  
747 age, prior to randomization.

748

## Chapter 5: Main Study Procedures

### 749 5.1 Procedures for the CLC Group

750 Participants assigned to the CLC group will receive study system training. These training  
751 sessions can occur on the same day or extend to up to one additional day if needed within 1-7  
752 days from randomization; participants will not take the study system home until training has  
753 been completed.

754 The parent/guardian will be trained on severe hypoglycemia emergency procedures including  
755 removal of the study pump and administration of glucagon. The parent/guardian will be asked to  
756 attend any/all of the other training procedures.

### 757 5.2 Study System Training

758 Participants will receive study system training by a qualified trainer. The study system includes  
759 the Tandem t:slim X2 with Control-IQ technology and associated Dexcom G6 CGM.

760 CGM training will include:

- 761 • The participant will be instructed and supervised on how to insert the sensor and transmitter.
- 762 • The participant will learn how to calibrate the CGM unit
- 763 • The participant will learn how to access the CGM trace via the t:slim X2 with Control-IQ user  
764 interface
- 765 • Participants will be asked to perform fingerstick blood glucose measurements in accordance  
766 with the labeling of the study CGM device

767 Pump training will include:

- 768 • The participant will be fully instructed on the study insulin pump. A qualified system trainer  
769 will conduct the training and in particular discuss differences from their home pump in  
770 important aspects such as calculation of insulin on board and correction boluses. Additional  
771 topics not limited to but may include: infusion site initiation, cartridge/priming procedures,  
772 setting up the pump, charging the pump, navigation through menus, bolus procedures including  
773 stopping a bolus, etc.
- 774 • The study team will assist the participant in study pump infusion site initiation and will start  
775 the participant on the study pump. The study pump will be programmed with the participant's  
776 usual basal rates and pump parameters. The participant's personal pump will be removed.
- 777 • The participant will be supervised with the study pump during at least one meal or snack bolus  
778 to ensure participant understanding of the pump features.
- 779 • The participant will be encouraged to review the literature provided with the pump and infusion  
780 sets after the training is completed.

781 Pump training specific to the Control-IQ Technology functions will include:

- 782 • How to turn on and off Control-IQ technology.
- 783 • How to understand when Control-IQ is increasing or decreasing basal rates.
- 784 • How to administer a meal or correction bolus on the t:slim X2 with Control-IQ system
- 785 • What to do when exercising while using the system
- 786 • How to enable the sleep function and set the sleep schedule
- 787 • The participant will be assessed for understanding of the system interface and how to react to
- 788 safety/alert messages.
- 789 • The participant will be given a User Guide as a reference.

### 790 **5.2.1 System Initiation**

791 The participant will be instructed to use the system in closed-loop mode except 1) when no  
 792 calibrated CGM sensor is available or 2) if insulin is delivered by any means other than the  
 793 study pump (e.g. injection of subcutaneous insulin via syringe in the event of infusion site failure).  
 794 If insulin is delivered by any means other than the study pump, participant will be instructed to  
 795 turn off Control-IQ for approximately four hours.

796 The participant will also be instructed to contact study staff during periods of illness with an  
 797 elevated temperature >101.5 degrees Fahrenheit (38.6 degrees Celsius), periods of significant  
 798 illness, or during periods of use of medications such as epinephrine for the emergency treatment  
 799 of a severe allergic reaction or asthma attack in addition to use of oral or injectable glucocorticoids  
 800 to determine if closed-loop use should be temporarily discontinued.

801 The participant's parent/legal guardian will be required to attend the training procedures and will  
 802 be trained in all aspects aforementioned. All training will be conducted considering age of  
 803 participant and parent involvement on diabetes treatment.

804 Participants will be provided with sufficient supplies to last until the subsequent visit.

805 Participants will be provided with contact information and will be asked to call the study  
 806 clinical staff for any health-related issues and for technical issues with t:slim X2 with  
 807 Control-IQ. Participants may use the study pump without Control-IQ activated and study  
 808 CGM during periods of component disconnections or technical difficulties. Participants will  
 809 also receive study staff contact information to ask any questions they may have during the study.

810 Study staff will discuss with the participant that routine contact is required and will make  
 811 arrangements with the participant for the contacts. If the participant cannot be reached, the  
 812 participant's other contact methods will be utilized, including the emergency contact. Participants  
 813 who are not compliant with the arranged contacts on two separate occasions may be discontinued  
 814 at the discretion of the investigator.

815 Upon completion of the t:slim X2 with Control-IQ training, study staff will document, using a  
 816 checklist, that the participant is familiar with the function/feature and/or capable of performing  
 817 each of the tasks specified.

818 Participants will be provided Hypoglycemia, Hyperglycemia and Ketone Guidelines (section 7.2)  
819 for when their glucose levels are >300 mg/dL for more than two hours or >400 mg/dL at any time  
820 or <70 mg/dL or ketones  $\geq$ 1.5 mmol/L.

### 821 **5.2.2 Home Use of the Study System**

822 After training on the study system has been completed, participants will proceed with home use  
823 (meaning free-living use at school, home, etc.) of the t:slim X2 with Control-IQ technology  
824 system.

825 Participants may use available manufacturer-provided software and features of the study CGM  
826 related to mobile data access or remote monitoring, but will be instructed not to use any third-party  
827 components for this purpose.

### 828 **5.2.3 Study Device Download**

829 Participants will be instructed to download the study device prior to each phone visit or on at least  
830 every 3-week basis throughout the remainder of the study.

### 831 **5.2.4 1-Week Phone Contact**

832 Study staff will perform a phone call with the participant within 7 ( $\pm$ 1) days following  
833 randomization.

834 The following will occur:

- 835 • Assessment of compliance with study device use by review of any available device data
- 836 • Assessment of adverse events, adverse device effects, and device issues
- 837 • Study staff will answer any questions related to device use

838 Participants will then complete an additional week of home use with the study system. Participants  
839 will return to clinic 14 ( $\pm$ 3) days from the date of randomization.

### 840 **5.2.5 2-Week Visit (Training Review and Insulin Pump Optimization)**

841 The participant will be offered review training to address any questions on the use of the study  
842 device including meal bolus strategies and strategies related to pump use and exercise.

843 The following will occur:

- 844 • Assessment of compliance with study device use by review of any available device data
- 845 • Assessment of adverse events, adverse device effects, and device issues
- 846 • Study staff will answer any questions related to device use and follow the procedure for insulin  
847 pump optimization described in section 3.6 using the study CGM available data from the  
848 previous two weeks.
- 849 • The blood glucose meter and study ketone meter will be downloaded and QC tested with  
850 control solution.

851 **5.3 Procedures for the SC Group**

852 Participants in the SC group will use an insulin pump that they usually use for the treatment of  
853 their diabetes or a study pump provided by the study team if they are transitioning from MDI to  
854 pump for the study, in conjunction with the study CGM, study blood glucose meter, and study  
855 ketone meter. Study pump training and/or study CGM training will be provided if the participant  
856 is initiating use of these devices at this point.

857 If a participant is using a pump with a LGS feature, he/she will be allowed to continue using this  
858 feature during the trial.

859 Participants may use available manufacturer-provided software and features of the study CGM  
860 related to mobile data access or remote monitoring, but will be instructed not to use any third-party  
861 components for this purpose.

862 **5.3.1 Study Device Data Download**

863 Participants will be instructed to upload data from the study CGM using commercially available  
864 software prior to the 1-week phone contact and prior to the 2-week clinic visit for clinician review.  
865 Participants will be provided with any software and hardware needed to perform these data  
866 uploads.

867 **5.3.2 1-Week Phone Contact**

868 Study staff will perform a phone call with the participant 7( $\pm$ 1) days following randomization.

869 The following will occur:

- 870
- 871 • Assessment of compliance with study device use by review of any available device data
  - 872 • Assessment of adverse events, adverse device effects, and device issues
  - 873 • Study staff will answer any questions related to device use

874 The participant will continue on SC for a second week, then return to the clinic 14 ( $\pm$ 3) days from  
875 the date of randomization.

876 **5.3.3 2-Week Visit (Training Review and Insulin Pump Optimization)**

877 The participant will be offered review training on the use of SC during the remainder of the study,  
878 including meal bolus strategies and strategies related to pump use and exercise.

879 The following will occur:

- 880
- 881 • Assessment of compliance with study device use by review of any available device data
  - 882 • Assessment of adverse events, adverse device effects, and device issues
  - 883 • Study staff will review uploaded CGM data, answer any questions related to device use, and  
884 follow the procedure for insulin pump optimization described in section 3.6.
  - 885 • The study blood glucose meter and study ketone meter will be downloaded and QC tested with

884 at least two different concentrations of control solution if available.

885 The participant will be instructed to upload data from the CGM at least once every 4 weeks for the  
886 remainder of the study.

## 887 **5.4 Follow-up Visits and Phone Contacts for Both Groups**

888 The schedule for remaining follow-up visits and phone contacts is the same for both treatment  
889 groups. Study staff will discuss with the participant that periodic contact is required and will make  
890 arrangements with the participant for the contacts. If the participant or parent/guardian, cannot be  
891 reached, the participant's other contact methods will be utilized, including the emergency contact.

### 892 **5.4.1 Follow-up Visits**

893 Follow-up visits in clinic will occur at:

- 894 • 2 week ( $\pm 3$  days)
- 895 • 8 weeks ( $\pm 1$  week)
- 896 • 16 weeks (+1 week) – end of Main Study Phase

#### 897 **5.4.1.1 Procedures at Follow-up Visits**

898 Procedures performed in both groups at each visit, unless otherwise specified below:

- 899 • Assessment of compliance with study device use by review of any available device data
- 900 • Assessment of adverse events, adverse device effects, and device issues
- 901 • Download of device data (study system or personal pump and study CGM, study BG meter,  
902 study ketone meter)

### 903 **5.4.2 Phone Contacts**

904 In addition to the 1-week phone contact described above for the respective treatment groups, the  
905 following phone contacts will be made:

- 906 • 4 weeks ( $\pm 3$  days)
- 907 • 6 weeks ( $\pm 3$  days)
- 908 • 10 weeks ( $\pm 3$  days)
- 909 • 12 weeks ( $\pm 3$  days)
- 910 • 14 weeks ( $\pm 3$  days)

911 At each phone contact, the following procedures are performed in both treatment groups:

- 912 • Review of available CGM and/or system data to identify any safety issues associated with  
913 insulin pump settings and current diabetes management approach
- 914 • Assessment of adverse events, adverse device effects, and device issues

915 Additional phone contacts may be performed as needed.

### 916 **5.4.3 Data from Study Devices**

917 All participants will be asked to upload data from the CGM at least once every 4 weeks during the  
918 extension phase. The study staff will confirm that the data were received.

### 919 **5.4.4 16-Week Final First Phase Visit**

920 All participants will return to the clinic for a 16-Week (+7 days) final clinic visit during which the  
921 following will occur:

- 922 • HbA1c determination using the DCA Vantage or similar point of care device
- 923 • Collection of a blood sample to send to the central laboratory for HbA1c determination
- 924 • Completion of questionnaires
- 925 • Weight and height measurement will be repeated
- 926 • Assessment of adverse events, adverse device effects, and device issues
- 927 • Download of device data (study system or personal pump and study CGM, study BG meter,  
928 study ketone meter)

### 929 **5.5 Early Termination Visit (If Applicable)**

930 Participants will be asked to come for an end of study visit in the event of withdrawal or early  
931 termination.

### 932 **5.6 Unscheduled Visits**

933 Participants may have unscheduled visits during the study period if required for additional device  
934 training or other unanticipated needs per the study investigator discretion.

### 935 **5.7 Participant Access to Study Device at Study Closure**

936 Participant will return all investigational study devices and supplies (insulin pump, CGM and  
937 related supplies) at study closure. Participant may keep the study ketone meter and study  
938 glucometer if these devices are not marked for investigational use only.

939

## Chapter 6: Extension Phase Procedures

940 At the conclusion of the 16-week visit, all participants will have the option to use of the Control-  
941 IQ closed-loop system.

### 942 **6.1 Closed Loop Control Participants**

943 Participants who have completed the 16-week Main Study Phase will be provided the option to  
944 continue the use the t:slim with Control-IQ System for an additional 12 weeks.

945 The following phone contacts will be made for CLC Group participants in the Extension Phase:

946 • 20 week ( $\pm 3$  days)

947 • 24 week ( $\pm 3$  days)

948 At each phone contact, the following procedures are performed:

949 Review of available CGM and/or system data to identify any safety issues associated with insulin  
950 pump settings and current diabetes management approach

951 • Assessment of adverse events, adverse device effects, and device issues

### 952 **6.2 SC Group Participants**

953 Training on pump (section 5.2) use will be provided and therapy optimization will occur as  
954 follows:

955 • If needed at the criteria of the physician at each clinical center, optimization may be done at  
956 either phone contacts or in clinic visits.

957 • If the study participant contacts the study physician due to concerns about their pump settings  
958 due to recurring hypo- or hyperglycemia.

959 Data will be obtained from CGM and/or pump downloads at the visit. Adjustments to pump  
960 settings (basal rates, correction factor, insulin-to-carbohydrate ratio, etc.) will be made in response  
961 to major trends observed in the CGM data, with flexibility for clinicians to adhere to guidelines  
962 and practices established at each individual practice rather than a fixed set of characteristics for all  
963 clinical centers.

964 The following phone contacts will be made for SC Group participants in the Extension Phase:

965 • 17 weeks ( $\pm 3$  days)

966 • 19 weeks ( $\pm 3$  days)

967 • 21 weeks ( $\pm 3$  days)

968 • 25 weeks ( $\pm 3$  days)

969 At each phone contact, the following procedures are performed:

970 • Review of available CGM and/or system data to identify any safety issues associated with  
971 insulin pump settings and current diabetes management approach

972 • Assessment of adverse events, adverse device effects, and device issues

973 Follow-up visits for SC group during the Extension Phase in clinic will occur at:

974 • 23 Weeks ( $\pm 1$  week)

975 • 28 Weeks (+1 week) – End of Study

976 Procedures Specific to the 28 Week Visit

977 • HbA1c determination using the DCA Vantage or similar point of care device

978 • Collection of a blood sample to send to the central laboratory for HbA1c determination

979 • Completion of questionnaires

980 • Weight measurement will be repeated, in addition to height

981 • Insulin Pump Optimization as described above

### 982 **6.3 Early Termination Visit (If Applicable)**

983 Participants will be asked to come for an end of study visit in the event of withdrawal or early  
984 termination.

### 985 **6.4 Unscheduled Visits**

986 Participants may have unscheduled visits during the study period if required for additional device  
987 training or other unanticipated needs per the study investigator discretion.

### 988 **6.5 Participant Access to Study Device at Study Closure**

989 Participant will return all investigational study devices and supplies (insulin pump, CGM and  
990 related supplies) at study closure. Participant may keep the study ketone meter and study  
991 glucometer if these devices are not marked for investigational use only.

992

## Chapter 7: Study Devices

### 993 7.1 Description of the Investigational Device

#### 994 7.1.1 Insulin Pump

995 The study system will include the Tandem t:slim X2 with Control-IQ technology.

#### 996 7.1.2 Continuous Glucose Monitoring

997 The study CGM will include Dexcom G6 transmitter and sensors when using the Tandem t:slim  
998 X2 with Control-IQ technology. This may not be an FDA-approved device system at the start of  
999 the study, but may become approved during the course of the study. The CGM sensor will be  
1000 replaced at least once every 10 days.

#### 1001 7.1.3 Blood Glucose Meter and Strips

1002 Blood glucose levels will be measured using the study's blood glucose meter (glucometer) and the  
1003 CGM device will be calibrated if needed using the study glucometer and strips in accordance with  
1004 the manufacturer's labeling.

#### 1005 7.1.4 Ketone Meter and Strips

1006 Blood ketone levels will be measured using the Abbott Precision Xtra meter and strips in  
1007 accordance with the manufacturer's labeling. The blood glucose meter component of the Precision  
1008 Xtra device will not be used.

#### 1009 7.1.5 Study Device Accountability Procedures

1010 Device accountability procedures will be detailed in the clinical center procedures manual.

#### 1011 7.1.6 Blood Ketone Testing

- 1012 • Participants to perform QC testing at home per manufacturer guidelines.
- 1013 • All study blood ketone meters will be QC tested with control solution if available during all  
1014 office visits. A tested meter will not be used in a study if it does not read within the target  
1015 range at each concentration per manufacturer labeling. The participant will be instructed to  
1016 contact study staff for a replacement of the meter, test strips, and control solution if a meter  
1017 fails QC testing at home.
- 1018 • Participants will be instructed on how to perform blood ketone testing.
- 1019 • Participants will be given guidelines for treatment of elevated blood ketones.

### 1020 7.2 Safety Measures

#### 1021 7.2.1 CGM Calibration

1022 Throughout the study, participants will be instructed to calibrate the study CGM in accordance  
1023 with manufacturer labelling.

1024 **7.2.2 System Failure**

1025 If the CGM signal becomes unavailable for more than 20 minutes consecutively, Control-IQ or  
1026 closed loop will not operate to automatically adjust insulin. If the CGM is not connected, the  
1027 system will revert to usual function of the pump and deliver insulin with the insulin dosing  
1028 parameters programmed in the system for that individual. Resumption of Closed-Loop will  
1029 occur automatically once CGM signal is available again.

1030 If the study system is unable to activate Control-IQ for any reason, the pump will automatically  
1031 revert to preprogrammed basal insulin delivery without any need for instruction from the user.

1032 If the t:slim X2 detects a system error that does not allow the pump to operate, the Malfunction  
1033 Alarm will display and the participant will be instructed to contact Tandem Technical Support via  
1034 the study team.

1035 **7.2.3 Hypoglycemia Threshold Alert and Safety Protocol**

1036 During the course of the study, participants will be permitted to change the CGM low glucose  
1037 threshold alert setting on their device or mobile app, but will be instructed to choose a value no  
1038 less than 70 mg/dL.

1039 The t:slim X2 with Control-IQ system will issue a predictive hypoglycemia alert (Control-IQ Low  
1040 Alert) when the system predicts BG <70 mg/dL within the next 15 minutes (<80 mg/dL when  
1041 exercise mode is activated).

1042 If the participant receives a Control-IQ Low Alert, a message appears on the user interface (UI)  
1043 that is accompanied by vibration followed by vibrations and/or sound if not acknowledged by the  
1044 user in 5 minutes. This alert remains on the screen until acknowledged by the user. The user is  
1045 prompted to test blood sugar and treat with carbs.

1046 **7.2.4 Hyperglycemia Threshold Alert and Safety Protocol**

1047 During the course of the study, participants will be permitted to change the CGM high glucose  
1048 threshold alert setting on their device or mobile app, but will be instructed to choose a value no  
1049 greater than 300 mg/dL.

1050 The t:slim X2 with Control-IQ system will issue a predictive hyperglycemia alert (Control-IQ  
1051 High Alert) when the system has increased insulin delivery, but detects a CGM value above 200  
1052 mg/dL and does not predict the value will decrease in the next 30 minutes.

1053 If the participant receives a Control-IQ High Alert, a message appears on the UI that is  
1054 accompanied by vibration followed by vibrations and/or sound if not acknowledged by the user in  
1055 5 minutes. This alert remains on the screen until acknowledged by the user. The user is prompted  
1056 to check the site for occlusion and test blood glucose.

1057 If a participant's CGM reading is >300 mg/dL for over 2 hours or  $\geq$ 400 mg/dL at any point, the  
1058 participant will be instructed to take the following steps:

- 1059
- Perform a blood glucose meter check.

- 1060 • If the blood glucose is  $>300$  mg/dL, check for blood ketones with the study ketone meter.
- 1061 • If the ketone level is  $\geq 1.5$  mmol/L, take correction insulin, change insulin (pump) infusion site
- 1062 and contact study staff.
- 1063 • If a participant administers correction insulin via insulin syringe, participants will be instructed
- 1064 to turn Control-IQ off for approximately four hours.

1065

## Chapter 8: Testing Procedures and Questionnaires

### 1066 8.1 Laboratory Testing

#### 1067 8.1.1 Comprehensive Metabolic Panel (CMP)

1068 A blood sample will be obtained at screening to assess kidney and liver functioning.

#### 1069 8.1.2 HbA1c:

- 1070 • Performed locally at the Screening visit, Randomization visit and the 16-week visit.
- 1071 • A blood sample will be obtained and sent to central lab at the Randomization visit, at the 16-
- 1072 week visit and at the end of the study visit.

#### 1073 8.1.3 Urine Pregnancy:

1074 Performed locally for females of child-bearing potential at the Screening visit and the  
1075 Randomization visit. This will also be done anytime pregnancy is suspected.

#### 1076 8.1.4 C-peptide and Glucose

1077 Blood samples will be obtained and sent to the central lab at the Randomization visit. Back-up  
1078 samples will be stored on-site until all samples are resulted.

### 1079 8.2 Questionnaires

1080 Questionnaires are completed at the Randomization Visit and Week 16 Visit for all participants.  
1081 Participants who complete the Extension Phase will also complete the questionnaires at Week 28.  
1082 The questionnaires will be family and age appropriate are described briefly below. The procedures  
1083 for administration are described in the clinical center procedures manual.

1084 The following questionnaires will be completed at the Randomization Visit:

- 1085 • Clarke's Hypoglycemia Awareness Scale – Child and Parent (Children age 10+ years at the  
1086 time of consent will complete as well as all Parents)
- 1087 • Fear of Hypoglycemia Survey (HFS-II) – Child and Parent
- 1088 • Problem Areas In Diabetes Survey (PAID) – Child and Parent
- 1089 • Pediatric Quality of Life – Child and Parent
- 1090 • INSPIRE Survey – Child and Parent
- 1091 • Pittsburgh Sleep Quality Index (PSQI) – Parent

1092 The following questionnaires will be completed at the Week 16 and Week 28 Visits:

- 1093 • Clarke's Hypoglycemia Awareness Scale – Child and Parent (Children age 10+ years at the  
1094 time of consent will complete as well as all Parents)

- 1095 • Fear of Hypoglycemia Survey (HFS-II) – Child and Parent
- 1096 • Problem Areas In Diabetes Survey (PAID) – Child and Parent
- 1097 • Pediatric Quality of Life – Child and Parent
- 1098 • INSPIRE Post-Assessment Survey – Child and Parent
- 1099 • Pittsburgh Sleep Quality Index (PSQI) – Parent
- 1100 • System Usability Scale (SUS) – Closed-Loop participants only

1101 Administration time is approximately 15 minutes.

1102 **8.2.1 Clarke’s Hypoglycemia Awareness Scale – Child and Parent**

1103 The scale comprises eight questions characterizing the participant's exposure to episodes  
 1104 of moderate and severe hypoglycemia. It also examines the glycemic threshold for, and  
 1105 symptomatic responses to hypoglycemia. A score of four or more on a scale of 0 to 7 implies  
 1106 impaired awareness of hypoglycemia.

1107 Administration time is approximately 5 minutes.

1108 **8.2.2 Hypoglycemia Fear Survey (HFS-II)/Low Blood Sugar Survey – Child and Parent**

1109 The Hypoglycemia Fear Survey-II was developed to measure behaviors and worries related to fear  
 1110 of hypoglycemia in adults with type 1 diabetes. It is composed of 2 subscales, the Behavior (HFS-  
 1111 B) and Worry (HFS-W). HFS-B items describe behaviors in which patients may engage to avoid  
 1112 hypoglycemic episodes and/or their negative consequences (e.g., keeping blood glucose levels  
 1113 higher, making sure other people are around, and limiting exercise or physical activity). HFS-W  
 1114 items describe specific concerns that patients may have about their hypoglycemic episodes (e.g.,  
 1115 being alone, episodes occurring during sleep, or having an accident). HFS-II was adapted for  
 1116 children and parents. Items are rated on a 5-point Likert scale (0=never, 4=always), with higher  
 1117 scores indicating higher fear of hypoglycemia.

1118 Administration time is approximately 10 minutes (both versions).

1119 **8.2.3 Problem Areas In Diabetes Survey (PAID) – Child and Parent**

1120 The Problem Areas In Diabetes Survey is a measure of diabetes-related emotional distress and  
 1121 consists of a scale of 16 items for the Parent version and 11 items for the Child version. Patients  
 1122 and parents rate the degree to which each item is currently problematic for them on a 6-point Likert  
 1123 scale, from 1 (no problem) to 6 (serious problem).

1124 Administration time is approximately 10 minutes.

1125 **8.2.4 PedsQL Diabetes Module – Child and Parent**

1126 This is a 33-item scale developed and validated for the measurement of diabetes-specific quality  
 1127 of life. Separate forms have been validated for child self-report (5-7 year old; 8-12 year old; and  
 1128 12-18 year old) and parent report for these same age groups. Participants record the extent to

1129 which they (or their child) experienced each of 33 problems related to diabetes in the prior  
1130 month.

1131 Administration time is approximately 15 minutes.

### 1132 **8.2.5 INSPIRE Survey – Child and Parent**

1133 The INSPIRE (Insulin Delivery Systems: Perceptions, Ideas, Reflections and Expectations) survey  
1134 was developed to assess various aspects of a user’s experience regarding automated insulin  
1135 delivery for both patients and family members. The surveys include various topics important to  
1136 patients with type 1 diabetes and their family members based upon >200 hours of qualitative  
1137 interviews and focus groups. The child pre-assessment survey includes 27 items, and the parent  
1138 pre-assessment survey includes 45 items. The post-assessment child survey includes 17 items, and  
1139 the parent post-assessment contains 21 items. Response options for all surveys include a 5-point  
1140 Likert scale from strongly agree to strongly disagree, along with an N/A option.

1141 Administration time is approximately 5 minutes.

### 1142 **8.2.6 Pittsburgh Sleep Quality Index (PSQI) – Parent**

1143 Pittsburgh Sleep Quality Index (PSQI) is a 10-item questionnaire that measures the sleep quality  
1144 and pattern of sleep in adults. Seven component scores are derived, each scored 0 (no difficulty)  
1145 to 3 (severe difficulty). The component scores are summed to produce a global score (range 0 to  
1146 21). Higher scores indicate worse sleep quality.

1147 Administration time is approximately 5 minutes.

### 1148 **8.2.7 System Usability Scale (SUS) – Closed-Loop participants only**

1149 The System Usability Scale (SUS) is a 10-item questionnaire that measures the overall usability of  
1150 a system. It is a valid and reliable measure of the perceived usability of a system and is technology-  
1151 agnostic. The questionnaire presents statements with five response options (anchoring the options  
1152 from strongly disagree to strongly agree) and asks users to rate their agreement to the statements.  
1153 User scores are transformed into a composite score, from 0 to 100, and this score is taken as an  
1154 overall measure of the system’s usability; higher scores indicate better perceived usability.

1155 Administration time is approximately 5 minutes.

1156 **Chapter 9: Adverse Events, Device Issues, and Stopping Rules**

1157 **9.1 Adverse Events**

1158 **9.1.1 Definitions**

1159 Adverse Event (AE): Any untoward medical occurrence in a study participant, irrespective of the  
1160 relationship between the adverse event and the device(s) under investigation (see section 9.1.2 for  
1161 reportable adverse events for this protocol).

1162 Serious Adverse Event (SAE): Any untoward medical occurrence that:

- 1163 • Results in death.
- 1164 • Is life-threatening; (a non-life-threatening event which, had it been more severe, might have  
1165 become life-threatening, is not necessarily considered a serious adverse event).
- 1166 • Requires inpatient hospitalization or prolongation of existing hospitalization.
- 1167 • Results in persistent or significant disability/incapacity or substantial disruption of the ability  
1168 to conduct normal life functions (sight threatening).
- 1169 • Is a congenital anomaly or birth defect.
- 1170 • Is considered a significant medical event by the investigator based on medical judgment (e.g.,  
1171 may jeopardize the participant or may require medical/surgical intervention to prevent one of  
1172 the outcomes listed above).

1173 Unanticipated Adverse Device Effect (UADE): Any serious adverse effect on health or safety or  
1174 any life-threatening problem or death caused by, or associated with, a device, if that effect,  
1175 problem, or death was not previously identified in nature, severity, or degree of incidence in the  
1176 investigational plan or application (including a supplementary plan or application), or any other  
1177 unanticipated serious problem associated with a device that relates to the rights, safety, or welfare  
1178 of participants (21 CFR 812.3(s)).

1179 Adverse Device Effect (ADE): Any untoward medical occurrence in a study participant which the  
1180 device may have caused or to which the device may have contributed (Note that an Adverse Event  
1181 Form is to be completed in addition to a Device Deficiency or Issue Form).

1182 Device Complaints and Malfunctions: A device complication or complaint is something that  
1183 happens to a device or related to device performance, whereas an adverse event happens to a  
1184 participant. A device complaint may occur independently from an AE, or along with an AE.  
1185 An AE may occur without a device complaint or there may be an AE related to a device complaint.  
1186 A device malfunction is any failure of a device to meet its performance specifications or otherwise  
1187 perform as intended. Performance specifications include all claims made in the labeling for the  
1188 device. The intended performance of a device refers to the intended use for which the device is  
1189 labeled or marketed. (21 CFR 803.3). Note: for reporting purposes, clinical centers will not be  
1190 asked to distinguish between device complaints and malfunctions.

1191 **9.1.2 Reportable Adverse Events**

1192 For this protocol, a reportable adverse event includes any untoward medical occurrence that meets  
1193 one of the following criteria:

- 1194 1. A serious adverse event
- 1195 2. An Adverse Device Effect as defined in section 9.1.1, unless excluded from reporting in section  
1196 9.2
- 1197 3. An Adverse Event occurring in association with a study procedure
- 1198 4. Hypoglycemia meeting the definition of severe hypoglycemia as defined below
- 1199 5. Diabetic ketoacidosis (DKA) as defined below or in the absence of DKA, a hyperglycemic or  
1200 ketosis event meeting the criteria defined below

1201 Hypoglycemia and hyperglycemia not meeting the criteria below will not be recorded as adverse  
1202 events unless associated with an Adverse Device Effect. Skin reactions from sensor placement are  
1203 only reportable if severe and/or required treatment.

1204 Pregnancy occurring during the study will be recorded.

1205 **9.1.2.1 Hypoglycemic Events**

1206 Hypoglycemia not associated with an Adverse Device Effect is only reportable as an adverse event  
1207 when the following definition for severe hypoglycemia is met: the event required assistance of  
1208 another person due to altered consciousness, and required another person to actively administer  
1209 carbohydrate, glucagon, or other resuscitative actions. This means that the participant was  
1210 impaired cognitively to the point that he/she was unable to treat himself/herself, was unable to  
1211 verbalize his/ her needs, was incoherent, disoriented, and/or combative, or experienced seizure or  
1212 coma. These episodes may be associated with sufficient neuroglycopenia to induce seizure or  
1213 coma. If plasma glucose measurements are not available during such an event, neurological  
1214 recovery attributable to the restoration of plasma glucose to normal is considered sufficient  
1215 evidence that the event was induced by a low plasma glucose concentration.

1216 **9.1.2.2 Hyperglycemic Events/Diabetic Ketoacidosis**

1217 Hyperglycemia not associated with an Adverse Device Effect is only reportable as an adverse  
1218 event when one of the following 4 criteria is met:

- 1219 • the event involved DKA, as defined by the Diabetes Control and Complications Trial (DCCT)  
1220 and described below
- 1221 • evaluation or treatment was obtained at a health care provider facility for an acute event  
1222 involving hyperglycemia or ketosis
- 1223 • blood ketone level  $\geq 1.5$  mmol/L and communication occurred with a health care provider at  
1224 the time of the event
- 1225 • blood ketone level  $\geq 3.0$  mmol/L, even if there was no communication with a health care  
1226 provider

1227 Hyperglycemic events are classified as DKA if the following are present:

- 1228 • Symptoms such as polyuria, polydipsia, nausea, or vomiting;
- 1229 • Serum ketones  $\geq 1.5$  mmol/L or large/moderate urine ketones;
- 1230 • Either arterial blood pH  $< 7.30$  or venous pH  $< 7.24$  or serum bicarbonate  $< 15$ ; and
- 1231 • Treatment provided in a health care facility

1232 All reportable Adverse Events—whether volunteered by the participant, discovered by study  
1233 personnel during questioning, or detected through physical examination, laboratory test, or other  
1234 means—will be reported on an adverse event form online. Each adverse event form is reviewed  
1235 by the Medical Monitor to verify the coding and the reporting that is required.

### 1236 **9.1.3 Relationship of Adverse Event to Study Device**

1237 The study investigator will assess the relationship of any adverse event to be related or unrelated  
1238 by determining if there is a reasonable possibility that the adverse event may have been caused by  
1239 the study device.

1240 To ensure consistency of adverse event causality assessments, investigators should apply the  
1241 following general guideline when determining whether an adverse event is related:

#### 1242 Yes

1243 There is a plausible temporal relationship between the onset of the adverse event and the study  
1244 intervention, and the adverse event cannot be readily explained by the participant's clinical state,  
1245 intercurrent illness, or concomitant therapies; and/or the adverse event follows a known pattern of  
1246 response to the study intervention; and/or the adverse event abates or resolves upon discontinuation  
1247 of the study intervention or dose reduction and, if applicable, reappears upon re-challenge.

#### 1248 No

1249 Evidence exists that the adverse event has an etiology other than the study intervention (e.g.,  
1250 preexisting medical condition, underlying disease, intercurrent illness, or concomitant  
1251 medication); and/or the adverse event has no plausible temporal relationship to study intervention.

### 1252 **9.1.4 Intensity of Adverse Event**

1253 The intensity of an adverse event will be rated on a three point scale: (1) mild, (2) moderate, or (3)  
1254 severe. It is emphasized that the term severe is a measure of intensity: thus, a severe adverse event  
1255 is not necessarily serious. For example, itching for several days may be rated as severe, but may  
1256 not be clinically serious.

- 1257 • **MILD:** Usually transient, requires no special treatment, and does not interfere with the  
1258 participant's daily activities.
- 1259 • **MODERATE:** Usually causes a low level of inconvenience or concern to the participant and  
1260 may interfere with daily activities, but is usually ameliorated by simple therapeutic measures.

- 1261 • SEVERE: Interrupts a participant’s usual daily activities and generally requires systemic drug  
1262 therapy or other treatment.

### 1263 9.1.5 Coding of Adverse Events

1264 Adverse events will be coded using the MedDRA dictionary. The Medical Monitor will review  
1265 the investigator’s assessment of causality and may agree or disagree. Both the investigator’s and  
1266 Medical Monitor’s assessments will be recorded. The Medical Monitor will have the final say in  
1267 determining the causality.

1268 Adverse events that continue after the participant’s discontinuation or completion of the study will  
1269 be followed until their medical outcome is determined or until no further change in the condition  
1270 is expected.

### 1271 9.1.6 Outcome of Adverse Event

1272 The outcome of each reportable adverse event will be classified by the investigator as follows:

- 1273 • RECOVERED/RESOLVED – The participant recovered from the AE/SAE without sequelae.  
1274 Record the AE/SAE stop date.

- 1275 • RECOVERED/RESOLVED WITH SEQUELAE – The event persisted and had stabilized  
1276 without change in the event anticipated. Record the AE/SAE stop date.

- 1277 • FATAL – A fatal outcome is defined as the SAE that resulted in death. Only the event that  
1278 was the cause of death should be reported as fatal. AEs/SAEs that were ongoing at the time of  
1279 death; however, were not the cause of death, will be recorded as “resolved” at the time of death.

- 1280 • NOT RECOVERED/NOT RESOLVED (ONGOING) – An ongoing AE/SAE is defined as the  
1281 event was ongoing with an undetermined outcome.

1282 ○ An ongoing outcome will require follow-up by the clinical center in order to determine the  
1283 final outcome of the AE/SAE.

1284 ○ The outcome of an ongoing event at the time of death that was not the cause of death, will  
1285 be updated and recorded as “resolved” with the date of death recorded as the stop date.

- 1286 • UNKNOWN – An unknown outcome is defined as an inability to access the participant or the  
1287 participant’s records to determine the outcome (for example, a participant that was lost to  
1288 follow-up).

1289 All clinically significant abnormalities of clinical laboratory measurements or adverse events  
1290 occurring during the study and continuing at study termination should be followed by the  
1291 participant’s physician and evaluated with additional tests (if necessary) until diagnosis of the  
1292 underlying cause, or resolution. Follow-up information should be recorded on source documents.

1293 If any reported adverse events are present when a participant completes the study, or if a participant  
1294 is withdrawn from the study due to an adverse event, the participant will be contacted for re-  
1295 evaluation within 2 weeks. If the adverse event has not resolved, additional follow-up will be  
1296 performed as appropriate. Every effort should be made by the Investigator or delegate to contact  
1297 the participant until the adverse event has resolved or stabilized.

1298 **9.2 Reportable Device Issues**

1299 All UADEs, ADEs, device complaints, and device malfunctions will be reported irrespective of  
1300 whether an adverse event occurred, except in the following circumstances.

1301 The following device issues are anticipated and will not be reported on a Device Issue Form but  
1302 will reported as an Adverse Event if the criteria for AE reporting described above are met:

- 1303 • Component disconnections
- 1304 • CGM sensors lasting fewer than the number of days expected per CGM labeling
- 1305 • CGM tape adherence issues
- 1306 • Pump infusion set occlusion not leading to ketosis
- 1307 • Battery lifespan deficiency due to inadequate charging or extensive wireless communication
- 1308 • Intermittent device component disconnections/communication failures not leading to system  
1309 replacement
- 1310 • Device issues clearly addressed in the user guide manual that do not require additional  
1311 troubleshooting
- 1312 • Skin reactions from CGM sensor placement or pump infusion set placement that do not meet  
1313 criteria for AE reporting

1314 **9.3 Pregnancy Reporting**

1315 If pregnancy occurs, the participant will be discontinued from the study. The occurrence of  
1316 pregnancy will be reported on an AE Form.

1317 **9.4 Timing of Event Reporting**

1318 SAEs and UADEs must be reported to the Coordinating Center within 24 hours via completion of  
1319 the online serious adverse event form.

1320 Other reportable adverse events, device malfunctions (with or without an adverse event), and  
1321 device complaints should be reported promptly by completion of an electronic case report form,  
1322 but there is no formal required reporting period.

1323 The Coordinating Center will notify all participating investigators of any adverse event that is  
1324 serious, related, and unexpected. Notification will be made within 10 days after the Coordinating  
1325 Center becomes aware of the event.

1326 Each principal investigator is responsible for reporting serious study-related adverse events and  
1327 abiding by any other reporting requirements specific to his/her Institutional Review Board or  
1328 Ethics Committee.

1329 Upon receipt of a UADE report, the Sponsor will investigate the UADE and if indicated, report  
1330 the results of the investigation to the clinical centers' IRBs, and the FDA within 10 working days  
1331 of the Sponsor becoming aware of the UADE per 21CFR 812.46(b). The Medical Monitor must  
1332 determine if the UADE presents an unreasonable risk to participants. If so, the Medical Monitor  
1333 must ensure that all investigations, or parts of investigations presenting that risk, are terminated as

1334 soon as possible but no later than 5 working days after the Medical Monitor makes this  
1335 determination and no later than 15 working days after first receipt notice of the UADE.

1336 In the case of a device system component malfunction (e.g. pump, CGM, control algorithm),  
1337 information will be forwarded to the responsible company by the clinical center personnel, to be  
1338 handled by its complaint management system.

## 1339 **9.5 Stopping Criteria**

### 1340 **9.5.1 Participant Discontinuation of Study Device**

1341 Rules for discontinuing study device use are described below.

- 1342 • The investigator believes it is unsafe for the participant to continue on the intervention. This  
1343 could be due to the development of a new medical condition or worsening of an existing  
1344 condition; or participant behavior contrary to the indications for use of the device that imposes  
1345 on the participant's safety
- 1346 • The participant requests that the treatment be stopped
- 1347 • Participant pregnancy
- 1348 • Two distinct episodes of DKA
- 1349 • Two distinct severe hypoglycemia events as defined in section 9.1.2.1

1350 If pregnancy occurs, the participant will be discontinued from the study entirely. Otherwise, even  
1351 if the study device system is discontinued, the participant will be encouraged to remain in the study  
1352 through the final study visit.

### 1353 **9.5.2 Criteria for Suspending or Stopping Overall Study**

1354 In the case of an unanticipated system malfunction resulting in a severe hypoglycemia or severe  
1355 hyperglycemia event (as defined in section 9.1.2.2), use of the study device system will be  
1356 suspended while the problem is diagnosed.

1357 In addition, study activities could be similarly suspended if the manufacturer of any constituent  
1358 study device requires stoppage of device use for safety reasons (e.g. product recall). The affected  
1359 study activities may resume if the underlying problem can be corrected by a protocol or system  
1360 modification that will not invalidate the results obtained prior to suspension. The study Medical  
1361 Monitor will review all adverse events and adverse device events that are reported during the study  
1362 and will review compiled safety data at periodic intervals (generally timed to the review of  
1363 compiled safety data by the DSMB). The Medical Monitor may request suspension of study  
1364 activities or stoppage of the study if deemed necessary based on the totality of safety data available.

## 1365 **9.6 Independent Safety Oversight**

1366 A Data and Safety Monitoring Board (DSMB) will review compiled safety data at periodic  
1367 intervals (typically every 6 months). In addition, the DSMB will review all DKA and severe  
1368 hypoglycemia irrespective of relatedness to study device use, and all serious events (including  
1369 UADEs) related to study device use at the time of occurrence. The DSMB also will be informed  
1370 of any ADEs not meeting criteria for a UADE if the Medical Monitor requests the DSMB

1371 review. The DSMB can request modifications to the study protocol or suspension or outright  
1372 stoppage of the study if deemed necessary based on the totality of safety data available. Details  
1373 regarding DSMB review will be documented in a separate DSMB document.

1374 **9.7 Risks**

1375 The potential risks associated with use of the study device are described in section 1.3.

1376 Additional risks are minor and/or infrequent and include:

- 1377 • Pain, bruising, redness, or infection from blood draws  
1378 • Loss of confidentiality  
1379 • Stress from completing quality of life questionnaires

1380

## **Chapter 10: Miscellaneous Considerations**

### **1381 10.1 Drugs Used as Part of the Protocol**

1382 Participants will use either lispro or aspart insulin prescribed by their personal physician.

### **1383 10.2 Prohibited Medications, Treatments, and Procedures**

1384 Participants using glulisine at the time of enrollment will be asked to contact their personal  
1385 physician to change their prescribed personal insulin to lispro or aspart for the duration of the trial  
1386 in the case they are randomized to experimental arm

1387 Treatment with any non-insulin glucose-lowering agent (including GLP-1 agonists, Symlin, DPP-  
1388 4 inhibitors, SGLT-2 inhibitors, biguanides, sulfonylureas and naturaceuticals) will not be  
1389 permitted.

1390 The investigational study devices (t:slim X2 insulin pump, study CGM systems) must be removed  
1391 before Magnetic Resonance Imaging (MRI), Computed Tomography (CT) or diathermy treatment.  
1392 Participants may continue in the trial after temporarily discontinuing use if requiring one of the  
1393 treatments above.

### **1394 10.3 Participant Withdrawal**

1395 Participation in the study is voluntary, and a participant may withdraw at any time. For participants  
1396 who withdraw, their data will be used up until the time of withdrawal.

### **1397 10.4 Confidentiality**

1398 For security and confidentiality purposes, participants will be assigned an identifier that will  
1399 be used instead of their name. Protected health information gathered for this study will be  
1400 shared with the coordinating center, the Jaeb Center for Health Research in Tampa, FL.  
1401 De-identified participant information may also be provided to research sites involved in the study.  
1402 De-identified participant information may also be provided to Tandem for system evaluation  
1403 purposes.

1404

## Chapter 11: Statistical Consideration

### 1405 11.1 Statistical and Analytical Plans

1406 The outcome metrics and the statistical analyses are summarized below. A detailed statistical  
1407 analysis plan will be written and finalized prior to the first tabulation of data by treatment group  
1408 (ie, for DSMB review). The analysis plan synopsis in this chapter contains the framework of the  
1409 anticipated final analysis plan.

### 1410 11.2 Statistical Hypotheses

1411 This study is an extension to children ages 6-13 years old, of the Main Protocol described in IDE  
1412 G180053, which includes N=168 children ages 14 and up and adults. Thus, the primary outcome  
1413 for this study is identical to the Main protocol - CGM-measured % in range 70-180 mg/dL.

1414 The hypotheses for the primary outcome are:

- 1415 a. *Null Hypothesis:* There is no difference in mean CGM-measured % in range 70-180 mg/dL  
1416 over 16 weeks between SC and CLC
- 1417 b. *Alternative Hypothesis:* The mean CGM-measured % in range 70-180 mg/dL over 16  
1418 weeks is different for SC and CLC.

### 1419 11.3 Sample Size

1420 Sample size has been computed for the primary outcome (CGM-measured % in range 70-180  
1421 mg/dL). Data from IDE G170267; Device Name: t:slim X2 with Control-IQ Technology; “Real-  
1422 Time Monitoring and Glucose Control During Winter-Sport Exercise in Youth with Type 1  
1423 Diabetes: The AP Ski Camp Continued” were used to calculate sample size specific to this age  
1424 group. In this study, which was completed in the winter of 2018, 24 school-aged children (6-12  
1425 years) with type 1 diabetes participated in a 3-day ski camp (~5 h skiing/day), followed by an  
1426 additional 72 hour at-home phase under parental supervision. Study participants were randomized  
1427 1:1 to SAP and t:slim X2 with Control-IQ Technology. The data from the 72-hour home phase  
1428 was used for this sample size calculation – *note that the closed-loop control system and the age  
1429 range of the participants are identical to those proposed in this application:*

Results from home phase of G170267	Control IQ	SAP	F	p value
Percent between 70 and 180mg/dl	71 ± 6.6	52.8 ± 13.5	16.4	0.001

1430 From the DCLP1 study using the same algorithm in an older cohort, the effective standard  
1431 deviation (after adjusting for the correlation between baseline and follow up) for time in range 70-  
1432 180 mg/dL over the course of 6 months was 6% (95% CI 5% to 7%) for the CLC group and 7%  
1433 (95% CI 6% to 8%) for the SAP group.

1434 A total sample size was computed to be N=60 for the following assumptions: (1) 3:1 [CLC:SC]  
1435 randomization, (2) 90% power, (3) a 10% absolute increase in % time in range 70-180 mg/dL, (4)  
1436 an effective SD of 10%, and (5) 2-sided type 1 error of 0.05.

1437 The total sample size has been increased to N=100 to account for dropouts and to increase the  
1438 number of participants who will be exposed to the CLC system for an enhanced safety and  
1439 feasibility assessment.

## 1440 **11.4 Efficacy Outcome Measures**

### 1441 **11.4.1 Primary Efficacy Endpoint**

- 1442 • CGM-measured % in range 70-180 mg/dL

### 1443 **11.4.2 Secondary Efficacy Endpoints**

#### 1444 **11.4.2.1 Secondary Efficacy Endpoints Included in Hierarchical Analysis**

1445 The following secondary endpoints will be tested in a hierarchical fashion as described in  
1446 section 11.7.1.

- 1447 • CGM-measured % above 180 mg/dL
- 1448 • CGM-measured mean glucose
- 1449 • HbA1c at 16 weeks
- 1450 • CGM-measured % below 70 mg/dL
- 1451 • CGM-measured % below 54 mg/dL
- 1452 • CGM-measured % above 250 mg/dL
- 1453 • Glucose variability measured with the coefficient of variation (CV)

#### 1454 **11.4.2.2 Other Secondary Efficacy Endpoints**

1455 The following endpoints are considered exploratory. Type 1 error for these endpoints will be  
1456 controlled using the false discovery rate (FDR) instead of the familywise error rate (FWER).

#### 1457 CGM-Measured:

- 1458 • % in range 70-140 mg/dL
- 1459 • glucose variability measured with the standard deviation (SD)
- 1460 • % <60 mg/dL
- 1461 • low blood glucose index
- 1462 • hypoglycemia events (defined as at least 15 consecutive minutes <70 mg/dL)
- 1463 • % >300 mg/dL
- 1464 • high blood glucose index
- 1465 • % in range 70-180 mg/dL improvement from baseline to 16 weeks  $\geq 5\%$
- 1466 • % in range 70-180 mg/dL improvement from baseline to 16 weeks  $\geq 10\%$

1467 HbA1c:

- 1468 • HbA1c <7.0% at 16 weeks
- 1469 • HbA1c <7.5% at 16 weeks
- 1470 • HbA1c improvement from baseline to 16 weeks >0.5%
- 1471 • HbA1c improvement from baseline to 16 weeks >1.0%
- 1472 • HbA1c relative improvement from baseline to 16 weeks >10%
- 1473 • HbA1c improvement from baseline to 16 weeks >1.0% or HbA1c <7.0% at 16 weeks

1474 Questionnaires

- 1475 • Fear of Hypoglycemia Survey (HFS-II) – total score, 2 subscales and 4 factor scores:
  - 1476 ♦ Behavior (avoidance and maintain high BG)
  - 1477 ♦ Worry (helplessness and social consequences)
- 1478 • Clarke Hypoglycemia Awareness Scores
- 1479 • Problem Areas In Diabetes Survey (PAID)
- 1480 • INSPIRE survey scores
- 1481 • PedsQL Diabetes Module – total score and 5 subscales:
  - 1482 ♦ Diabetes
  - 1483 ♦ Treatment I
  - 1484 ♦ Treatment II
  - 1485 ♦ Worry
  - 1486 ♦ Communication
- 1487 • Pittsburgh Sleep Quality Index (Parent only)
- 1488 • System Usability Scale (SUS)

1489 Other:

- 1490 • Insulin
  - 1491 ♦ Total daily insulin (units/kg)
  - 1492 ♦ Basal: bolus insulin ratio
- 1493 • Weight and Body Mass Index (BMI)

#### 1494 **11.4.3 CGM Metrics Calculations**

1495 Randomization is preceded by two weeks of CGM run-in, which will be used in the calculation  
1496 of baseline CGM metrics. For participants who are eligible to skip the run-in, comparable

1497 amount of CGM data from their own sensors will be taken before randomization visit to  
1498 calculate baseline CGM metrics.

1499 CGM data starting from randomization visit through the 16-week visit will be included in the  
1500 calculation of each CGM metric. Percentages in range 70-180 mg/dL (and all other CGM-based  
1501 metrics) will be calculated giving equal weight to each CGM point for each participant.

## 1502 **11.5 Analysis Datasets and Sensitivity Analyses**

1503 All analyses comparing the CLC arm with SC arm will follow the intention-to-treat (ITT)  
1504 principle with each participant analyzed according to the treatment assigned by randomization.  
1505 All randomized participants will be included in the primary and secondary hierarchical analyses.

1506 Safety outcomes will be reported for all enrolled participants, irrespective of whether the  
1507 participants was randomized or the study was completed.

### 1508 **11.5.1 Per Protocol Analyses**

1509 Per-protocol analyses will be performed for primary outcome and secondary hierarchical  
1510 outcomes only if >5% of participants will be excluded:

- 1511 • CLC arm: Closed loop mode active for at least 80% of the time
- 1512 • SC arm: CGM use for at least 80% of the time

### 1513 **11.5.2 Other Sensitivity Analyses**

#### 1514 Confounding

1515 The primary analysis described below will include a pre-specified list of covariates. As an  
1516 additional sensitivity analysis, any baseline demographic or clinical characteristics observed to  
1517 be imbalanced between treatment groups will be added as covariates to the analyses of the  
1518 primary endpoint. The determination of a meaningful baseline imbalance will be based on  
1519 clinical judgement and not a p-value.

#### 1520 Exclude First 2 Weeks of CGM Data

1521 As noted above in Section 11.4.3, calculation of CGM metrics will include all available post-  
1522 randomization CGM data. As a sensitivity analysis, CGM metrics will be recalculated by  
1523 excluding the first two weeks of CGM data following the randomization visit. The primary  
1524 analysis will be replicated based on the recalculated outcome.

#### 1525 Missing Data

1526 It is worth emphasizing that any statistical method for handling missing data makes a number of  
1527 untestable assumptions. The goal will be to minimize the amount of missing data in this study so  
1528 that results and conclusions will not be sensitive to which statistical method is used. To that end,

1529 sensitivity analyses will be performed to explore whether results are similar for primary analysis  
1530 when using different methods. The following methods will be applied:

- 1531 • Direct likelihood (primary analysis described below)
- 1532 • Rubin's multiple imputation
- 1533 • Multiple imputation with pattern mixture model
- 1534 • Available cases only

### 1535 **11.6 Analysis of the Primary Efficacy Endpoint**

1536 Summary statistics (mean  $\pm$  SD or median (quartiles)) will be reported for the CGM-measured %  
1537 in range 70-180 mg/dL and for differences from pre-randomization by treatment group.

1538 Changes from run-in pre-randomization CGM wear to the 16-week post-randomization period in  
1539 CGM-measured % in range 70-180 mg/dL between two treatment arms will be compared using a  
1540 linear mixed effects regression model while adjusting for baseline CGM-measured % in range  
1541 70-180 mg/dL, age, prior CGM and pump use, and clinical center (random effect). Missing data  
1542 will be handled using direct likelihood. Residual values will be examined for an approximate  
1543 normal distribution. If residuals are highly skewed, then a transformation or robust statistical  
1544 method (e.g., non-parametric or MM estimation) will be used instead. It is expected that the  
1545 residual values for CGM-measured % in range 70-180 mg/dL will follow an approximate normal  
1546 distribution.

### 1547 **11.7 Analysis of the Secondary Endpoints**

1548 Point estimated and confidence intervals for the treatment arm differences will be presented for  
1549 all secondary metrics. The models will adjust for the corresponding baseline metric, age, prior  
1550 CGM and pump use, and clinical center (random effect).

#### 1551 **11.7.1 Hierarchical Analyses**

1552 To preserve the overall type 1 error for selected key secondary endpoints, a hierarchical testing  
1553 procedure will be used. If the primary analysis for time in range described above results in a  
1554 statistically significant result ( $p < 0.05$ ), then testing (similar with the model described above  
1555 for the primary outcome) will proceed to the next outcome metric in the following order:

- 1556 • CGM-measured % in range 70-180 mg/dL (primary outcome)
- 1557 • CGM-measured % above 180 mg/dL
- 1558 • CGM-measured mean glucose
- 1559 • HbA1c at 16 weeks
- 1560 • CGM-measured % below 70 mg/dL
- 1561 • CGM-measured % below 54 mg/dL
- 1562 • CGM-measured % above 250 mg/dL

1563 • Glucose variability measured with the coefficient of variation (CV)  
 1564 This process continues iteratively moving to the next variable down on the list until a non-  
 1565 significant result ( $p \geq 0.05$ ) is observed, or all eight variables have been tested. If a non-  
 1566 significant result is encountered, then formal statistical hypothesis testing is terminated and  
 1567 any variables below on the list are not formally tested.

1568 For example, in the hypothetical scenario depicted in the table below, the first four outcome  
 1569 variables all have a significant result so testing continues to the fifth variable (CGM % below 70  
 1570 mg/dL). The result is not significant for that fifth variable ( $p = 0.06$ ) so testing stops. No formal  
 1571 hypothesis test is conducted for the last three variables on the list in this example scenario.

HIERARCHICAL ORDER	OUTCOME VARIABLE	TREATMENT ARM P-VALUE	SIGNIFICANT?	ACTION
1 <sup>st</sup>	CGM % 70-180 mg/dL (primary outcome)	0.001	Yes	Test next variable
2 <sup>nd</sup>	CGM % above 180 mg/dL	0.02	Yes	Test next variable
3 <sup>rd</sup>	CGM mean glucose	0.007	Yes	Test next variable
4 <sup>th</sup>	HbA1c at 16 weeks	0.03	Yes	Test next variable
5 <sup>th</sup>	CGM % below 70 mg/dL	0.06	No	Stop formal testing
6 <sup>th</sup>	CGM % below 54 mg/dL	Not tested	Unknown	N/A
7 <sup>th</sup>	CGM % above 250 mg/dL	Not tested	Unknown	N/A
8 <sup>th</sup>	Glucose CV	Not tested	Unknown	N/A

1572 **Table 6. Example Hypothetical Hierarchical Test Results**

1573 Regardless of the results of the hierarchical testing, summary statistics appropriate to the  
 1574 distribution will be tabulated by treatment arm for each hierarchical outcome. A 95% confidence  
 1575 interval for the treatment arm difference will also be calculated for all seven secondary  
 1576 hierarchical outcomes listed above. However, a confidence interval that excludes zero will not  
 1577 be considered a statistically significant result if an outcome variable higher on the hierarchical  
 1578 list failed to reach statistical significance.

1579 **11.7.2 Other Endpoint Analyses**

1580 CGM-Measured Outcomes

1581 The analyses for the secondary CGM-measured outcomes will parallel those mentioned above  
 1582 for the primary outcome. For the binary CGM outcomes, risk-adjusted percentages by treatment  
 1583 group will be calculated from a logistic regression model.

1584 HbA1c

1585 Summary statistics (mean  $\pm$  SD) will be reported for the central lab HbA1c at baseline, 16 weeks  
 1586 and for differences from pre-randomization by treatment group.

1587 Change in HbA1c from baseline to 16 weeks will be compared between the two treatment arms  
1588 using a linear model while adjusting for baseline HbA1c, age, prior CGM and pump use, and  
1589 clinical center (random factor).

1590 For extension phase, efficacy of the AP will be compared by using the final 12 weeks of the  
1591 control period vs. the 12-week AP extension phase. Each participant will be their own control.

1592 Missing data will be handled using direct likelihood in a regression model including all available  
1593 central laboratory HbA1c measurements at baseline and 16-week visits. When available, the  
1594 local HbA1c measurement will be included in the regression model as an auxiliary variable.

1595 For the binary HbA1c outcomes listed above, risk-adjusted percentages by treatment group will  
1596 be computed from a logistic regression model. The logistic regression will adjust for the same  
1597 factors mentioned above for the analysis with HbA1c as a continuous factor (i.e., baseline  
1598 HbA1c, age, prior CGM and pump use, and clinical center as a random effect).

#### 1599 Questionnaires and Other Outcomes

1600 For questionnaires administered to both randomization groups, comparisons will be made using  
1601 similar linear models as described above for the primary outcomes. Separate models will be run  
1602 for the total score and each of the subscales listed above.

1603 Similarly, for insulin, weight and BMI metrics comparisons will be made using similar linear  
1604 models as described above for the primary HbA1c analysis.

#### 1605 **11.8 Safety Analyses**

1606 All randomized participants will be included in these analyses and all their post-randomization  
1607 safety events will be reported.

1608 Safety analyses of the main study (randomized trial phase) will include events occurring on or  
1609 after randomization until and including the 16-week visit or Day 126 from randomization,  
1610 whichever occurs first. Safety analyses of the extension phase will include subsequent events  
1611 until the last visit date or the last event date (whichever is later).

1612 Any pre-randomization adverse events will be tabulated separately and will include all  
1613 participants even if never randomized.

1614 For the following outcomes, mean  $\pm$  SD or summary statistics appropriate to the distribution will  
1615 be tabulated by treatment group and formal statistical comparisons (main study phase only) will  
1616 be performed if there are enough events (at least 5 events combined between the two treatment  
1617 groups):

- 1618 • Number of SH events and SH event rate per 100 person-years
- 1619 • Number of DKA events and DKA event rate per 100 person-years
- 1620 • Any adverse event' rate per 100 person-years

- 1621 • Number of calendar days with any ketone level  $\geq 1.0$  mmol/L
- 1622 • CGM-measured hypoglycemic events ( $\geq 15$  minutes with glucose concentration  $< 54$  mg/dL)
- 1623 • CGM-measured hyperglycemic events ( $\geq 15$  minutes with glucose concentration  $> 300$
- 1624 mg/dL)

1625

1626 If enough events, the numbers of SH/DKA events will be compared between the two treatment  
 1627 arms during the main study phase using a robust Poisson regression. The regression will adjust  
 1628 for the participant-reported number of events prior to the start of the study and clinical center as  
 1629 random effect. The amount of follow up will be included as an offset covariate to compare the  
 1630 rates. Similar analyses will be done for comparing any adverse event and number of calendar  
 1631 days with ketone events between the two treatment groups, except that clinical center will be the  
 1632 only covariate to be adjusted in the model.

1633 For CGM-measured hypoglycemia/hyperglycemia events, event rates per week will be compared  
 1634 using similar linear mixed effects regression models as described above for the primary outcome.

1635

1636 For both the main study and extension phases, the following safety outcomes will be tabulated by  
 1637 treatment group without a formal statistical comparison:

- 1638 • Other serious adverse events (SAE)
- 1639 • BG-measured hypoglycemic events (days with at least one BG record  $< 54$  mg/dL)
- 1640 • BG-measured hyperglycemic events (days with at least one BG record  $> 350$  mg/dL)
- 1641 • Worsening of HbA1c from baseline to 16 weeks by  $> 0.5\%$
- 1642 • Investigational device related (intervention group only):
  - 1643 ○ Adverse device effects (ADE)
  - 1644 ○ Serious adverse device events (SADE)
  - 1645 ○ Unanticipated adverse device effects (UADE)

1646

### 1647 **11.9 Intervention Adherence**

1648 The following tabulations and analyses will be performed by treatment group to assess  
 1649 intervention adherence for the study:

- 1650 • Sensor use –percent time of use, overall and by 4-weekly
- 1651 • The daily frequency of downloaded BGM use overall and by 4-weekly

1652 For CLC arm only, the following will be tabulated to assess adherence:

- 1653 • % time in different operational modes - overall and by 4-weekly

1654 **11.10 Adherence and Retention Analyses**

1655 The following tabulations and analyses will be performed by treatment group to assess protocol  
1656 adherence for the study:

- 1657 • Number of protocol and procedural deviations per participant along with the number and  
1658 percentage of participants with each number of deviations
- 1659 • Number of protocol and procedural deviations by severity with brief descriptions listed
- 1660 • Flow chart accounting for all participants at all scheduled visits and phone contacts post  
1661 treatment initiation to assess visit and phone completion rates
- 1662 • Number of and reasons for unscheduled visits and phone calls
- 1663 • Number of participants who stopped treatment and reasons

1664 **11.11 Baseline Descriptive Statistics**

1665 Baseline demographic and clinical characteristics of the cohort of all randomized participants  
1666 will be summarized in a table using summary statistics appropriate to the distribution of each  
1667 variable. Descriptive statistics will be displayed by treatment group.

1668 Will include:

- 1669 • Age
- 1670 • HbA1c
- 1671 • Gender
- 1672 • Race/Ethnicity
- 1673 • Family income, education, and/or insurance status
- 1674 • Insulin method before enrollment (pump vs. MDI)
- 1675 • CGM use before enrollment
- 1676 • Diabetes duration
- 1677 • BMI (height and weight)
- 1678 • C-peptide
- 1679 • Participant-reported number of SH and DKA 12 months prior to the start of the study

1680 **11.12 Device Issues**

1681 The following tabulations and analyses will be performed by treatment group to assess device  
1682 issues:

- 1683 • Device malfunctions requiring study team contact and other reported device issues

- 1684 • Sensor performance metrics (difference, absolute relative difference, and International  
1685 Organization for Standardization criteria) – if applicable, by sensor version.
- 1686 • Rate of different failure events and alarms per 24 hours recorded by the Control-IQ system –  
1687 overall and by month

### 1688 **11.13 Planned Interim Analyses**

1689 All above efficacy and safety analyses will be conducted after all subjects completed the primary  
1690 study phase. No sample size re-estimation will be needed for the extension phase. The data may  
1691 be used for PMA, with no interruption on the extension phase.

1692 In addition, the DSMB will review safety data at intervals, with no formal stopping rules other  
1693 than the guidelines provided in the participant-level and study-level stopping criteria (as defined  
1694 in Section 9.5 of the protocol).

### 1695 **11.14 Subgroup Analyses**

1696 In exploratory analyses, the primary outcome (time 70-180 mg/dL), % time <70 mg/dL and HbA1c  
1697 at 16 weeks will be assessed separately in various subgroups and for continuous variables  
1698 according to the baseline value as defined below. Tests for interaction with treatment group will  
1699 be performed and further explored if an interaction will be found in the first place.

1700 Interpretation of subgroup analyses will depend on whether the overall analysis demonstrates a  
1701 significant treatment group difference. In the absence of such an overall difference and if  
1702 performed, subgroup analyses will be interpreted with caution. For continuous variables, results  
1703 will be displayed in subgroups based on cutpoints although the analysis will utilize the variable as  
1704 continuous, except for age which will be analyzed both as a continuous variable and in two age  
1705 groups. If there is insufficient sample size in a given subgroup, the cutpoints for continuous  
1706 measures may be adjusted per the observed distribution of values. Cutpoint selection for display  
1707 purposes will be made masked to the outcome data.

- 1708 • Baseline HbA1c
- 1709 • Baseline CGM time spent <70 mg/dL
- 1710 • Baseline CGM time spent >180 mg/dL
- 1711 • Baseline CGM time 70-180 mg/dL
- 1712 • Device use before the enrollment: pump/MDI, CGM/no CGM, and combinations of both
- 1713 • Age
- 1714 • Sex
- 1715 • Race/ Ethnicity
- 1716 • Clinical center
- 1717 • BMI (Height and weight)
- 1718 • Family income, education, and/or insurance status

1719 • C-peptide level

1720 **11.15 Multiple Comparison/Multiplicity**

1721 Primary Analysis

1722 Since there will be a single comparison for the primary outcome (CGM-measured % 70-180  
1723 mg/dL), no adjustment is needed.

1724 Secondary Hierarchical Analyses

1725 The hierarchical testing procedure described above in section 11.7.1 will be used to control the  
1726 overall type 1 error for the primary outcome plus seven key secondary outcomes identified above.

1727 All Other Secondary Analyses

1728 For all above-mentioned secondary analyses, the false discovery rate will be controlled using the  
1729 adaptive Benjamini-Hochberg procedure.

1730 **11.16 Exploratory Analyses**

1731 In addition to the analysis for the CGM-measured endpoints described earlier, separate analyses  
1732 will be conducted for daytime and nighttime.

1733 The CGM-measured analyses will be replicated with only CGM data when the closed-loop was  
1734 active for the CLC group. The CGM data for the SC group will be the same as mentioned above  
1735 in the CGM Metrics Calculation section 11.4.3.

1736

## Chapter 12: Data Collection and Monitoring

### 1737 12.1 Case Report Forms and Device Data

1738 The main study data are collected through a combination of electronic case report forms  
1739 (CRFs) and electronic device data files obtained from the study software and individual hardware  
1740 components. These electronic device files and electronic CRFs from the study website are  
1741 considered the primary source documentation.

1742 When data are directly collected in electronic case report forms, this will be considered the source  
1743 data. Each participating clinical center will maintain appropriate medical and research records for  
1744 this trial, in compliance with ICH E6 and regulatory and institutional requirements for the  
1745 protection of confidentiality of participants.

### 1746 12.2 Study Records Retention

1747 Study documents should be retained for a minimum of 2 years after the last approval of a marketing  
1748 application in an ICH region and until there are no pending or contemplated marketing applications  
1749 in an ICH region or until at least 2 years have elapsed since the formal discontinuation of clinical  
1750 development of the investigational product. These documents should be retained for a longer  
1751 period, however, if required by local regulations. No records will be destroyed without the written  
1752 consent of the sponsor, if applicable. It is the responsibility of the sponsor to inform the  
1753 investigator when these documents no longer need to be retained.

### 1754 12.3 Quality Assurance and Monitoring

1755 Designated personnel from the Coordinating Center will be responsible for maintaining quality  
1756 assurance (QA) and quality control (QC) systems to ensure that the clinical portion of the trial is  
1757 conducted and data are generated, documented and reported in compliance with the protocol, Good  
1758 Clinical Practice (GCP) and the applicable regulatory requirements. Adverse events will be  
1759 prioritized for monitoring.

1760 A risk-based monitoring (RBM) plan will be developed and revised as needed during the course  
1761 of the study, consistent with the FDA “Guidance for Industry Oversight of Clinical Investigations  
1762 — A Risk-Based Approach to Monitoring” (August 2013). Study conduct and monitoring will  
1763 conform with 21 Code of Federal Regulations (CFR) 812.

1764 The data of most importance for monitoring at the clinical center are participant eligibility and  
1765 adverse events. Therefore, the RBM plan will focus on these areas. As much as possible, remote  
1766 monitoring will be performed in real-time with on-site monitoring performed to evaluate the verity  
1767 and completeness of the key clinical center data. Elements of the RBM may include:

- 1768 • Qualification assessment, training, and certification for clinical centers and clinical center  
1769 personnel
- 1770 • Oversight of Institutional Review Board (IRB) coverage and informed consent procedures
- 1771 • Central (remote) data monitoring: validation of data entry, data edits/audit trail, protocol

- 1772 review of entered data and edits, statistical monitoring, study closeout
- 1773 • On-site monitoring (site visits): source data verification, site visit report
- 1774 • Agent/Device accountability
- 1775 • Communications with clinical center staff
- 1776 • Participant retention and visit completion
- 1777 • Quality control reports
- 1778 • Management of noncompliance
- 1779 • Documenting monitoring activities
- 1780 • Adverse event reporting and monitoring
- 1781 Coordinating Center representatives or their designees may visit the study facilities at any time
- 1782 in order to maintain current and personal knowledge of the study through review of the records,
- 1783 comparison with source documents, observation and discussion of the conduct and progress of the
- 1784 study.
- 1785 **12.4 Protocol Deviations**
- 1786 A protocol deviation is any noncompliance with the clinical trial protocol, GCP, or procedure
- 1787 requirements. The noncompliance may be either on the part of the participant, the investigator, or
- 1788 the clinical center staff. As a result of deviations, corrective actions are to be developed by the
- 1789 clinical center and implemented promptly.
- 1790 The clinical center PI/study staff is responsible for knowing and adhering to the IRB requirements.
- 1791 Further details about the handling of protocol deviations will be included in the monitoring plan.

1792

## **Chapter 13: Ethics/Protection of Human Participants**

### **1793 13.1 Ethical Standard**

1794 The investigator will ensure that this study is conducted in full conformity with Regulations for  
1795 the Protection of Human Participants of Research codified in 45 CFR Part 46, 21 CFR Part 50, 21  
1796 CFR Part 56, and/or the ICH E6.

### **1797 13.2 Institutional Review Boards**

1798 The protocol, informed consent form(s), recruitment materials, and all participant materials will  
1799 be submitted to the IRB for review and approval. Approval of both the protocol and the consent  
1800 form must be obtained before any participant is enrolled. Any amendment to the protocol will  
1801 require review and approval by the IRB before the changes are implemented to the study. All  
1802 changes to the consent form will be IRB approved; a determination will be made regarding whether  
1803 previously consented participants need to be re-consented.

### **1804 13.3 Informed Consent Process**

#### **1805 13.3.1 Consent Procedures and Documentation**

1806 Informed consent is a process that is initiated prior to the individual's agreeing to participate in the  
1807 study and continues throughout the individual's study participation. Extensive discussion of risks  
1808 and possible benefits of participation will be provided to the participants and their families.  
1809 Consent forms will be IRB-approved and the participant will be asked to read and review the  
1810 document. The investigator will explain the research study to the participant and answer any  
1811 questions that may arise. All participants will receive a verbal explanation in terms suited to their  
1812 comprehension of the purposes, procedures, and potential risks of the study and of their rights as  
1813 research participants. Participants will have the opportunity to carefully review the written consent  
1814 form and ask questions prior to signing.

1815 The participants should have the opportunity to discuss the study with their surrogates or think  
1816 about it prior to agreeing to participate. The participant will sign the informed consent and child  
1817 assent documents prior to any procedures being done specifically for the study. The participants  
1818 may withdraw consent at any time throughout the course of the trial. A copy of the informed  
1819 consent and child assent documents will be given to the participants for their records. The rights  
1820 and welfare of the participants will be protected by emphasizing to them that the quality of their  
1821 medical care will not be adversely affected if they decline to participate in this study.

#### **1822 13.3.2 Participant and Data Confidentiality**

1823 The study monitor, other authorized representatives of the sponsor, representatives of the IRB or  
1824 device company supplying study product may inspect all documents and records required to be  
1825 maintained by the investigator, including but not limited to, medical records (office, clinic, or  
1826 hospital) for the participants in this study. The clinical center will permit access to such records.

1827 The study participant's contact information will be securely stored at each clinical center for  
1828 internal use during the study. At the end of the study, all records will continue to be kept in a  
1829 secure location for as long a period as dictated by local IRB and Institutional regulations.

1830 Study participant research data, which is for purposes of statistical analysis and scientific reporting,  
1831 will be transmitted to and stored at the Jaeb Center for Health Research and the University of  
1832 Virginia Center for Diabetes Technology. This will not include the participant's contact or  
1833 identifying information. Rather, individual participants and their research data will be identified  
1834 by a unique study identification number. The study data entry and study management systems  
1835 used by clinical centers and by Jaeb research staff will be secured and password protected. At the  
1836 end of the study, all study databases will be de-identified and archived at Jaeb Center for Health  
1837 Research and the University of Virginia Center for Diabetes Technology. Permission to transmit  
1838 data will be included in the informed consent.
