1 Standard Disclaimer

The intent of this DSIC is to provide confidence that the data distributed by the NIDDK repository is a true copy of the study data. Our intent is not to assess the integrity of the statistical analyses reported by study investigators. As with all statistical analyses of complex datasets, complete replication of a set of statistical results should not be expected in secondary analysis. This occurs for a number of reasons including differences in the handling of missing data, restrictions on cases included in samples for a particular analysis, software coding used to define complex variables, etc. Experience suggests that most discrepancies can ordinarily be resolved by consultation with the study data coordinating center (DCC), however this process is labor-intensive for both DCC and Repository staff. It is thus not our policy to resolve every discrepancy that is observed in an integrity check. Specifically, we do not attempt to resolve minor or inconsequential discrepancies with published results or discrepancies that involve complex analyses, unless NIDDK Repository staff suspect that the observed discrepancy suggests that the dataset may have been corrupted in storage, transmission, or processing by repository staff. We do, however, document in footnotes to the integrity check those instances in which our secondary analyses produced results that were not fully consistent with those reported in the target publication.

2 Study Background

The Epidemiology of Diabetes Interventions and Complications (EDIC) study was initiated as follow-up to examine the long-term effects of the original DCCT interventions on diabetic complications such as cardiovascular events and advanced retinal and renal disease. Over 90 percent of participants from the DCCT study were followed by the EDIC study. Similar to the DCCT study, glycosylated hemoglobin values, fasting lipid levels, serum creatinine values, and other risk factors for cardiovascular disease were measured at different intervals for participants. Cardiovascular complications were assessed with standardized means and classified by an independent committee. The EDIC study has found that intensive diabetes therapy reduced risk of cardiovascular disease in patients with type 1 diabetes and that the differences in outcomes between the intensive and conventional therapy groups persist after long-term study.

3 Archived Datasets

The SAS data file, as provided by the Data Coordinating Center (DCC), are located in the data package. For this replication, variables were taken from the SAS file nih_cmri_risk1240.

4 Statistical Methods

Analyses were performed to duplicate results for the data published by Turkbey, et al [1] in Circulation in September 2011. To verify the integrity of the dataset, descriptive statistics were computed.

5 Results

For Table 1 in the publication [1], Clinical Characteristics of Epidemiology of Diabetes Interventions and Complications Participants at the Time of the Cardiac Magnetic Resonance Examination, Table A lists the variables that can be used in the replication. Table B compares the results calculated from the archived data file to the results published in Table 1. The results of the replication are an exact match when available.

6 Conclusions

The NIDDK repository is confident that the EDIC data files to be distributed are an exact match to the manuscript data when available.

Table A: Variables used to replicate Table 1. Clinical Characteristics of Epidemiology of Diabetes Interventions and Complications Participants at the Time of the Cardiac Magnetic Resonance Examination.

Table Variable	Variables Used in Replication from the Dataset(s)
Age, y	AGE
Duration of diabetes mellitus, y	IDDMYR
Smoking, %	SMOKE
BMI, kg/m ²	BMI
Mean BMI, kg/m ²	DTED_BMI
SBP, mm Hg	SBP
Mean SBP, mm Hg	DTED_SBP
DBP, mm Hg	DBP
Mean DBP, mm Hg	DTED_DBP
Hypertension, %	HT
Antihypertensive medication, %	HYPERTEN
Total cholesterol, mg/dL	TCHOL
Mean total cholesterol, mg/dL	DTED_CHL
Recent HDL, mg/dL	HDL
Mean HDL, mg/dL	DTED_HDL
Recent LDL, mg/dL	LDL
Mean LDL, mg/dL	DTED_LDL
Recent triglycerides, mg/dL	TRIG
Mean triglycerides, mg/dL	DTED_TRG
Hypercholesterolemia, %	HLIP
Lipid-lowering medication, %	LIPID
Recent HbA1c, %	HBA1C
Mean HbA1c, %	WTMHBA
Framingham Risk Score	FSCORE
Clinical or silent MI	-Not included in the dataset
Adjudicated clinical MI events	-Not included in the dataset
Silent MI	-Not included in the dataset
CAC score >0 (years 7–9)	CTGT0
CAC score >200 (years 7–9)	CTGT200
Common IMT (year 12)	COMMNW12
PDR or worse	ANYPDR
Macroalbuminuria/ESRD	ANYAE300
Sustained microalbuminuria/ESRD	ANYSAE30

Table Variable	Variables Used in Replication from the Dataset(s)
Autonomic neuropathy	AFTEDIC13
Peripheral neuropathy	CCNEDIC
Participants with 0 complications	COMP_SCORE
Participants with 1 complication	COMP_SCORE
Participants with 2 complications	COMP_SCORE
Participants with >=3 complications	COMP_SCORE
