I. INTRODUCTION

The T1DGC Coordinating Center will perform quality control (QC) studies throughout the time period that data are collected. The Coordinating Center will be assisted in the performance of these duties by the Regional Network Centers, the clinics and the Quality Control Committee.

There are two primary purposes for quality control. The most important purpose is to provide feedback to the data collection clinics in order to maintain and improve the quality of the study data over the course of data collection. A secondary purpose is to historically document the level of quality for inclusion in study publications.

Quality control involves the collection of specific types of data and the subsequent analysis of that data. It is primarily a measure of the quality of data either collected by the clinics or samples analyzed by laboratories associated with the study.

Quality control is accomplished in many different ways depending upon the type of data being collected, the type of procedure being analyzed, and the associated outcome variable in question. The quality control measures used in the T1DGC study will assess the reliability and validity of the data and proper adherence to the protocol.

The tools that will be used include:

1. Monitoring of:
 - a. recruitment efforts
 - b. specimen tracking
 - c. data completeness
 - d. freezer temperatures

2. Internal surveillance with:
 - a. editing forms (at the clinic and Regional Network Center)
 - b. laboratory internal quality control procedures

3. External surveillance of:
 - a. variability of laboratory measurements, using split pair samples
 - b. data entry error rates
 - c. data edits

This section has been developed to outline the procedures to be performed in order to assure that quality data are being collected and reported.

II. COORDINATING CENTER RESPONSIBILITIES

The T1DGC Coordinating Center has primary responsibility for monitoring and ensuring the overall quality of the study data. Specific responsibilities of the Coordinating Center in developing and carrying out quality control measures are listed below:

1. Organize and conduct Regional Network Center training sessions for standardized data collection protocols.
2. Organize and conduct Regional Network Laboratory (DNA Repositories, Autoantibody and Storage Laboratories, and HLA Genotyping Laboratories) training sessions for the T1DGC Specimen Tracking System protocol.
3. Review pilot study data and certify clinic readiness to initiate T1DGC data collection.
4. Maintain an up-to-date file of all completed Regional Network Center data entry certification and clinics certified to collect data.
5. Design protocol and procedures for periodic site visits to the Regional Network Centers and Regional Network Laboratories to check for quality of performance and adherence to T1DGC standardized procedures.

6. Develop a system for monitoring study recruitment and communication with the Regional Network Coordinators regarding recruitment progress and issues.
7. Develop a system for promptly processing and analyzing incoming data and generating quality control reports for distribution to the Regional Network Centers and Regional Network Laboratories.
8. Identify problems and notify Regional Network Centers of the quality of performance of network and clinic personnel throughout the entire data collection period.
9. Identify problems and notify Regional Network Laboratories of the quality of performance of their laboratories throughout the entire data collection period.
10. Develop and maintain a system for tracking all T1DGC specimens from collection at the clinics to receipt at the Regional Network Laboratories and from Regional Network Laboratories to receipt at the Regional HLA Laboratories, NIDDK Central Repositories, the Center for Inherited Disease Research, MHC Fine Mapping Laboratory, Rapid Response Laboratory, Diabetes and Inflammation Laboratory, contributing investigators, and other facilities or entities approved by the T1DGC Steering Committee or Access Committee.
11. Report pertinent information to the Quality Control Committee, Steering Committee and External Advisory Committee.
12. Maintain historical data that describes the quality and performance of the entire T1DGC study.

13. Produce and maintain the study documents related to T1DGC quality control:
(1) the reports presented to the Quality Control Committee and Steering Committee during data collection; and (2) documents found in reports to the T1DGC External Advisory Committee.

III. REGIONAL NETWORK CENTER RESPONSIBILITIES

Given the study structure, the T1DGC has a two-tiered quality control scheme. Each Regional Network Center maintains all direct contact with the clinics collecting data within their specified region. Thus, quality control measures are implemented by the Regional Network Centers at the clinic level, with specific responsibilities outlined below:

1. Organize and conduct clinic training sessions for standardized data collection protocols. Training sessions can be centralized, one-on-one or a combination of these techniques within any given Regional Network.
2. Notify the Coordinating Center when clinic training has been completed and when a pilot study has been performed.
3. Maintain an up-to-date file of all completed Regional Network Center data entry certification, clinics certified to collect data, clinic IDs and clinic staff IDs.
4. Monitor recruitment at each clinic and develop and implement strategies to achieve recruitment goals as needed.
5. Review completeness of form sets upon receipt from clinics and notify clinics of missing forms.
6. Review forms for completeness and notify clinics of missing data and errors in form completion.

7. Develop and implement a system for tracking requests for data forms, data verification or data correction from clinics in accordance with outlined procedures.
8. Design protocol and procedures for periodic site visits that check for quality of performance and adherence to T1DGC standardized procedures in clinics where specific serious problems have been identified.
9. Review *T1DGC Daily Freezer Temperature Log* from clinics on a monthly basis and notify clinic of problems noted.
10. Monitor clinic compliance with quality control scheme for blood collection and notify clinic if inadequate collection of quality control samples noted.

IV. QUALITY CONTROL COMMITTEE

T1DGC study data is primarily of two types: (1) laboratory and (2) forms. Thus, the Quality Control Committee is comprised of four subcommittees: (1) DNA Repositories, (2) Autoantibody and Storage Laboratories, (3) HLA Genotyping Laboratories, and (4) Forms Data. The overall committee includes members from each of the Regional Network Laboratories, the Regional Network Centers and the Coordinating Center. (Appendix A provides a list of the Quality Control Committee members and an organizational chart.)

The Quality Control Committee will meet as needed to review the status of the study quality control monitoring. Decisions regarding current and proposed techniques will be discussed, as well as current issues. The committee will be kept abreast of issues through frequent correspondence with the Chair of the Quality Control Committee and the Project Director.

V. SITE VISITS

A. Regional Network Center and Laboratories

During the first 6 months of data collection, and annually thereafter as needed, site visits will be made to each of the Regional Network Centers and Regional Network Laboratories. The goals of the site visits are: (1) to observe the Regional Network Center or Regional Network Laboratory under normal operating conditions for adherence to protocol; (2) to identify and resolve any data collection issues at the individual clinics (for Regional Network Center site visits only); (3) to identify and resolve any sample shipment, handling and analysis procedures (for Regional Network Laboratory site visits only); (4) to increase/improve communication between the Coordinating Center and Regional Network Center and Regional Network Laboratory personnel; and (5) to demonstrate the study's concern for the quality of data collection.

The site visits will be conducted in a single day, unless issues at the Regional Network Center or Regional Network Laboratory necessitate an extended visit. The site visit team for the Regional Network Centers will consist of the Project Director (Coordinating Center), Project Manager (Coordinating Center) and, if possible, the Project Officer(s) from NIDDK and/or the JDRF. The site visit team for the Regional Network Center Laboratories will consist of the Chair of the Quality Control Committee, the Project Director (Coordinating Center), and, if possible, the Project Officer(s) from NIDDK and/or the JDRF. An agenda is prepared and distributed to the Regional Network Center or Regional Network Laboratory prior to the site visit. (Appendix B contains examples of site visit agendas for Regional Network Centers and each type of Regional Network Laboratory.)

Following the site visits, a formal report is prepared. For Regional Network Center site visits, the report is written by the Project Director and Project Manager at the Coordinating Center; the Chair of the Quality Control Committee prepares the site visit reports for the Regional Network Laboratories. Site visit reports are distributed to the Chair of the Steering Committee, the Chair of the Quality Control Committee, the Project Director of the Coordinating Center, the Project Officer at NIDDK, the JDRF liaison, and the

Regional Network Center or Regional Network Laboratory visited. These individuals will discuss these reports on a conference call, if required; this group will make recommendations for the follow-up and correction of problem areas in a timely manner. The Principal Investigator at the Regional Network Center or Regional Network Laboratory will be asked to respond in writing in a timely manner regarding the resolution of issues.

B. Data Collection Clinics

Due to the large number of clinics within the Regional Network Centers, annual site visits to all clinics are not planned. However, Regional Network Centers may identify certain clinics where continued or serious issues regarding data collection or sample shipments require a site visit. In this event, the Regional Network Center will confer with the Coordinating Center and develop an agenda for the site visit. The site visit will include observation of collection of blood and completion of forms for a family. (Appendix C contains sample check sheets for blood collection and shipping procedures.)

Following the site visit, the Network Coordinator will prepare a formal report to be distributed to the Chair of the Steering Committee, the Chair of the Quality Control Committee, the Project Director of the Coordinating Center, the Project Officer at NIDDK, the JDRF liaison and the Principal Investigator and Clinic Coordinator of the clinic visited. These individuals will discuss the report on a conference call with the Network Coordinator and/or Network Principal Investigator, if required; this group will make recommendations for the follow-up and correction of problem areas in a timely manner. Each Clinic Coordinator and Clinic Principal Investigator will be asked to respond in writing in a timely manner regarding the resolution of any major problems.

VI. QUALITY CONTROL PROCEDURES

This section details the quality control procedures that are to be carried out for specified components.

A. Identifying Participants for Duplicate Blood Collection

The Clinic Coordinator is responsible for identifying the T1DGC participants for

whom the quality control duplicate blood collection will be performed. The participants selected are referred to as "QC participants". A *T1DGC Participant and QC Selection Log* has been developed to assist in the selection and tracking of quality control participants. In the event that the additional sample cannot be collected on the identified participant, the nurse or technician collects the duplicate sample on the next appropriate participant.

Given the overall volume of blood being collected, the additional quality control tube is collected only in participants that are at least 16 years old (or large for their age). The additional serum and plasma volume required for quality control is split between two participants: QC-Red for autoantibodies and serum storage and QC-Purple for plasma storage and DNA extraction from the cell pack. A QC-Red participant must be an affected individual (*i.e.*, must have type 1 diabetes). A QC-Purple participant in an affected sibling pair (ASP) or trio family can be any age- or size-eligible individual. In the case-control collection, only a control can be a QC-Purple participant.

The quality control sampling for the QC-Red participant within each clinic is outlined below:

1. There is no QC-Red collected during the clinic's pilot study.
2. An affected individual (proband, affected sibling or case) from the first two T1DGC collections will have an additional serum tube collected. The selected individuals should not be in the same family.
3. After the collection of the first two QC-Red samples, every 10th affected participant will have an additional serum tube collected.
4. After the collection of an additional five QC-Red samples (for a total of seven QC-Red samples), every 20th affected individual will have an additional serum tube collected.
5. For clinics with primarily pediatric populations, a QC-Red sample should be collected from every age (or size) eligible participants to provide adequate duplicate samples.

The quality control sampling for the QC-Purple participant within each clinic is outlined below:

1. There is one QC-Purple collected during the clinic's pilot study.
2. Any age- or size-eligible individual from the first two T1DGC collections will have an additional plasma tube collected. These participants should not be in the same family.
3. After the collection of the first two QC-Purple samples, every 10th participant will have an additional plasma tube collected.
4. After the collection of additional five QC-Purple samples (for a total of seven QC-Purple samples), every 20th participant will have additional plasma tube collected.

Once a participant is identified as a QC-Red or QC Purple participant, the Clinic Coordinator should provide the appropriate label set to the nurse or technician. The nurse will place a quality control ID label on the Blood Collection Form, the duplicate sample, the duplicate aliquots (for serum and plasma) and the shipping forms. (See Appendix D for a schematic of the duplicate blood collection sampling procedures and the contents of the QC label sets.)

The quality control ID label will have the same color scheme and participant identifier as the T1DGC ID (*i.e.*, if an affected sibling is selected as a quality control participant, the QC ID label will be green with an -04 as the participant identifier.)

B. Regional Network Laboratories

The Coordinating Center will receive laboratory results for examined participants on a monthly basis from each type of laboratory as outlined below:

1. DNA Repositories: data for the DNA yield from the EDTA cell pack and/or cell line and for the cell line transformation success/failure.
2. Autoantibody and Storage Laboratories: data for autoantibody measures (GAD65, IA-2_{ic}, TPO, TG, H⁺/K⁺ ATPase, and ZnT8) on probands, affected

siblings and cases.

3. HLA Genotyping Laboratories: data for HLA-A, B, C, DP, DQ, DRB1 and subtypes and *CTLA4* and *INS* SNPs for all participants

The quality of performance in the DNA Repositories will be based largely on the cell line transformation rate and the DNA yield from cell packs and /or cell lines. Further, those using the DNA (e.g., the HLA Genotyping Laboratories) will report any issues with the quality of the samples to the Coordinating Center. The Chair of the Quality Control Committee and the Project Director at the Coordinating Center will investigate any noted problems regarding DNA quality.

To assess the quality of the measures from the Autoantibody Laboratories Laboratories, a two-pronged system will be implemented. First, univariate analyses will be conducted on the monthly data results uploaded to the Coordinating Center. Within each laboratory, comparison of data results over time will be recorded. Based on these analyses, summary statistics (e.g., means, variances) and out-of-range values will be obtained and, if necessary, investigated further.

Second, duplicate measures will be performed on an approximate 5% random sample of participants for autoantibody measures. Duplicate serum samples will be sent by the clinics to the laboratory in the sample shipments. To the extent possible, the laboratory will be blinded as to which samples were paired.

In addition to graphical inspection of the data, reliability will be assessed using correlation coefficients and the technical error measurement for autoantibody measures. (The technical error is the square root of the pooled between measures variance as a percent of the sample mean: $((\text{Sqrt}(\sum d^2/2n))/\text{sample mean}) * 100$.) The technical error is compared to the laboratories internal coefficient of variation. If there is evidence of high technical error then the laboratory will be contacted and asked for an explanation.

HLA genotyping quality control is assessed by two separate procedures: (1) continuous blind quality control where four randomly selected samples from a single pedigree are incorporated on each new plate of 92 samples; and (2) an annual blind QC panel exercise of 92 samples chosen from production pedigree samples previously typed by the T1DGC HLA Laboratories, and simultaneously, independently, re-typed by all HLA Laboratories. The first procedure provides a low level, on-going check of intra-laboratory consistency that can alert the Coordinating Center and HLA Laboratory to a sustained drop in genotyping quality. The second procedure provides a measure of inter-laboratory consistency and accuracy as well as intra-laboratory consistency. All inter-and intra-laboratory discrepancies are thoroughly investigated and resolved.

For the first procedure, duplicate HLA genotype measures will be performed on a random 5% of samples. Under the direction of the Coordinating Center, the DNA Repositories will provide duplicate DNA samples within each set of 92 samples sent to the HLA Genotyping Laboratories. To the extent possible, the laboratory will be blinded to the pairing of the original and duplicate samples. The proportion of discordant allele calls will be assessed.

For the second procedure, each laboratory genotypes an identical set of 92 samples, with approximately the same number of samples contributed from each of the networks. The 92 samples are included on a single plate with 4 negative controls, as is the case with T1DGC production samples.

C. Shipping and Data Collection Forms

1. Shipping Forms

The clinics will forward a copy of their shipping forms to the Regional Network Center as part of standard documentation. These forms include: (1) a copy of the shipping forms sent with the daily shipment of cell line and EDTA cell packs to the DNA Repositories; and (2) a copy of shipping forms sent with the monthly shipment of blood samples to the Autoantibody and Storage Laboratories.

Upon receipt of the samples, laboratory staff completes the shipping forms with the necessary information and enters the data into the specimen tracking system. The laboratory staff makes a copy of the shipping forms for their records and sends the original shipping forms to the Regional Network Center. The Regional Network Center staff verifies that data entry of the forms was performed accurately.

2. Data Collection Forms Review

Each Regional Network Center is required to submit a 5% random sample of form sets to the Coordinating Center on a quarterly basis for a manual quality control review. A list of randomly generated ID numbers for each clinic will be supplied by the Coordinating Center.

The manual review of forms by staff of the Coordinating Center will entail a page-by-page review of the following items:

1. form completion;
2. affixed T1DGC ID and quality control labels, when applicable;
3. interviewer IDs;
4. skip patterns observed;
5. data collection errors corrected according to study protocol;
6. ethnicity and study coding; and
7. overall form consistency and preparedness for data entry.

A report of errors and/or recommendations for improvement will be sent to the Regional Network Center and the Project Director of the Coordinating Center following each review.

3. Duplicate Data Entry

All study forms are entered at the Regional Network Centers. Following manual review, the 5% random sample of participant form sets sent by the Regional Network Center on a quarterly basis will be data entered at the Coordinating Center to estimate the data entry error rate. A field-by-field comparison will be made between the original and the

re-entered record at the Coordinating Center. A report that indicates which fields were discordant and form-specific error rates will be generated. The first-pass error rates will be adjudicated (via the hard-copy of the form) for data entry errors before final reports are sent to the Regional Network Center.

The resulting error rates will be summarized and forwarded to the Regional Network Center for review. **All** forms from the time period being evaluated where the random sample error rate is 0.50% or greater will be re-entered. The double entry of the 5% sample will be an ongoing process so that the Coordinating Center can identify specific problems. Duplicate data entry analysis initially will occur quarterly; however, this will be reassessed in view of the volume of re-entry required in the Regional Network Centers.

D. Error, Warning and Informational Messages

The T1DGC Data Entry System requires a minimum number of completed fields before a form can be accepted. Validation checks in the form of error, warning and informational messages are applied during data entry. Insofar as possible, corrections will be made as the data are entered.

An error message will display for data values that are critical and must be corrected before data is saved. A warning message will display for data values that should be verified and/or edited by the clinic; however data can be saved if a warning message is displayed. An informational message will display if the data is out of the “expected” range; entry should be checked at the Regional Network Center, but data does not have to be confirmed by the clinic.

E. Query System

The T1DGC Query System was created to resolve data editing questions. It is to be used as a tool for the Regional Network Centers to record and identify sources of action taken to correct data collection or data entry errors or to correct or verify out-of-range or unexpected database values at either the Regional Network Center or clinic level. The responses that the Regional Network Centers enter into this system are used to create

reports for the Forms Data Quality Control Committee, the Steering Committee and the External Advisory Committee.

The Query System is dynamic, allowing the Regional Network Centers to identify at one time the entire list of queries for each family ID. Queries are created from the warning messages seen at the time of data entry, as well as cross-form validation checks that appear on the Irregularities Report.

The Regional Network Center first determines that the query is not a data entry error. Once this is confirmed, the Regional Network Center will send any unresolved queries back to the clinic for resolution.

The clinic and the Regional Network Center can either verify or edit queries. The user can filter queries that have been verified so they no longer appear in the Query System. The Project Managers at the Coordinating Center are responsible for reviewing queries that have been verified on a monthly basis. If a query has been verified and it is considered pertinent information for the T1DGC, the Project Manager changes the status of the query and notifies the Regional Network Center that verification of this query is unacceptable. Once a query has been verified by the Coordinating Center Project Manager, the query will be removed from other reports (*i.e.*, the Irregularities Report).” (See **Chapter XI**, *Data Entry System*, for detailed instructions in the use of the T1DGC Query System.)

APPENDIX B
SITE VISIT AGENDAS

**AGENDA
REGIONAL NETWORK CENTER
SITE VISITS**

- I. Observation of Family Collection (if possible)
- II. Review of Recruitment
 - A. Goals
 - B. Recruitment Strategies and Materials
 - C. Changes to Projections (through current fiscal period)
- III. Review of Data Entry/ Edits
 - A. Missing Data
 - B. Errors
 - C. Data Entry Flow (time from collection to entry)
- IV. Review of Logs
 - A. Daily Freezer Temperature Log
 - B. Discarded ID Log
 - C. Participant and QC Selection Log/ Adequacy of QC Sampling
 - D. Data Editing Log
 - E. Other Network Center or Clinic Logs (e.g., Staff IDs, Clinic IDs, etc)
- V. Storage of Forms
 - A. Data Collection Forms from Clinics
 - B. Shipping Forms from Laboratories
 - C. Layered Portion of Informed Consent Forms from Clinics
 - D. IRB Approvals/Informed Consents
- VI. Study Documents
 - A. Manual of Operations
 - B. Protocol
- VII. T1DGC Label Sets
 - A. Label Storage at Network Center
 - B. Systems for Distribution to Clinic and Tracking
 - C. Estimated Need for Additional Label Sets
- VIII. Miscellaneous
 - A. Communication with Clinics
 - B. Communication with Coordinating Center
 - C. "Problem Clinics"
 - D. Reimbursement/ Invoicing
 - E. Adverse Events
 - F. Application to Eligibility Committee
 - G. Notification to Destroy Sample Forms

Agenda for the Site Visit to the DNA Repository for the North American Regional Network

8:00 Introductions

8:05 Review the Agenda

8:10 Review Plan of the Consortium – Transformation of Peripheral Blood Cells, Isolation of DNA

Several laboratories throughout the world will be transforming peripheral blood mononuclear cells for the Consortium, extracting DNA from transformed cells, storing DNA and shipping to other locations for analyses (including HLA genotyping).

Current plan for North America includes samples from clinical centers affiliated with the North American Regional Network.

Expected numbers of samples from affected sibling pair (ASP) families, trio families, cases and controls

Shipments

What are the expected times for transport from distant sites (e.g., Canada)?

Shipments completed to date (specific issues to be discussed, if necessary).

9:00 Method for Transformation of Peripheral Blood Mononuclear Cells

Method used in Seattle – Overview

Proposed Workflow – Overview

Cost structures for several services: transforming cells, storing transformed cells, extracting DNA, storing DNA and shipping DNA or transformed cells to other locations (repositories or investigators)

Use of fetal calf serum (supplied from the USA)

Capacity to complete transformations with other current and future obligations

10:30 Tour of the Cell Transformation Facility, including Receiving Area

11:30 Discussions among all participants

Agenda for the Site Visit to the Autoantibody and Storage Laboratory for North American Network

8:00 Introductions

8:05 Review the Agenda

8:10 Review Plan of the Consortium – Measurements of Islet Antibodies
Three laboratories in Europe, Australia and North America will be measuring antibodies (initially, GAD65 and IA-2_{ic}).

Current plan for North America includes samples from clinical centers affiliated with the North American Network. Expected numbers of samples from affected individuals (type 1 diabetes) to be analyzed for the T1DGC

Shipments

Well established protocols from shipping samples from the clinics.
Costs of shipping containers back to the clinics.

8:30 Methods for Measuring Islet Antibodies
Methods proposed in Denver – Overview, similarities of the revised method to methods in Bristol and Melbourne. Similarities and differences between the method in Denver and those in Bristol and Melbourne. Review the radioactive labels used in each assay. Demonstrate that using double label assays in Denver will yield identical assays among the three laboratories. Calculations for the unknowns using a single calibrator.

10:00 Review results from the DASP surveys -- Please present the results with the assay which produces results closest to those in Bristol and Melbourne.

11:00 Overview of proposed workflow
Cost structures for shipping samples to other locations.

12:00 Tour of the Laboratory, including Receiving Area

12:30 Review of T1DGC Specimen Tracking System

Agenda for the Site Visit to the HLA Genotyping Laboratory for the Asia-Pacific Regional Network

13:30 Introductions

13:35 Review the Agenda

13:40 Review Plan of the Consortium – Isolation of DNA and Completion of HLA Typing

Several laboratories throughout the world will complete HLA genotyping using kits from Roche Molecular Systems in Alameda, CA. The DNA extracted from collected blood or transformed cells will be analyzed in an identical manner using 96-well plates with consistent reporting protocols to the Coordinating Center. To provide DNA promptly, the Melbourne HLA Genotyping Laboratory will be extracting and utilizing DNA from EDTA-anti-coagulated blood (frozen cell pack).

Expected Numbers of Samples in the Asia-Pacific Regional Network

14:00 Tour of HLA Genotyping Facility, including Storage Area

14:30 Methods and resources

Method used currently in Melbourne – Overview

Specific items for discussion include the following:

- Methods used and volume of samples genotyped in past three years

- Experience of personnel in using various methods for HLA genotyping

- Participation in HLA workshops and verification of results by third-party laboratories

- Success in using DNA provided by other laboratories for HLA genotyping or for other techniques or procedures

- Systems used to receive and track the inventory of samples

- Turnaround time to complete HLA analyses

- Experience with SCORE to interpret results and determine HLA genotypes

- Procedures utilized to report results to other entities, including coordinating centers for clinical studies or trials

- Progress of certification studies to demonstrate proficiency of the laboratory in the methods of the Consortium

- Facilities available for the method of the Consortium

16:00 Progress and preparation for assaying samples sent in the first quarter of 2004

- Demonstration that the laboratory has the facilities and trained personnel to complete the assays in a timely manner.

- Summary of the experience of the laboratory to complete similar work in an efficient manner from receipt of samples to reporting results to the Coordinating Center.

4. When two alternate phrasings are given, appropriate one chosen	1	2	_____

APPENDIX D

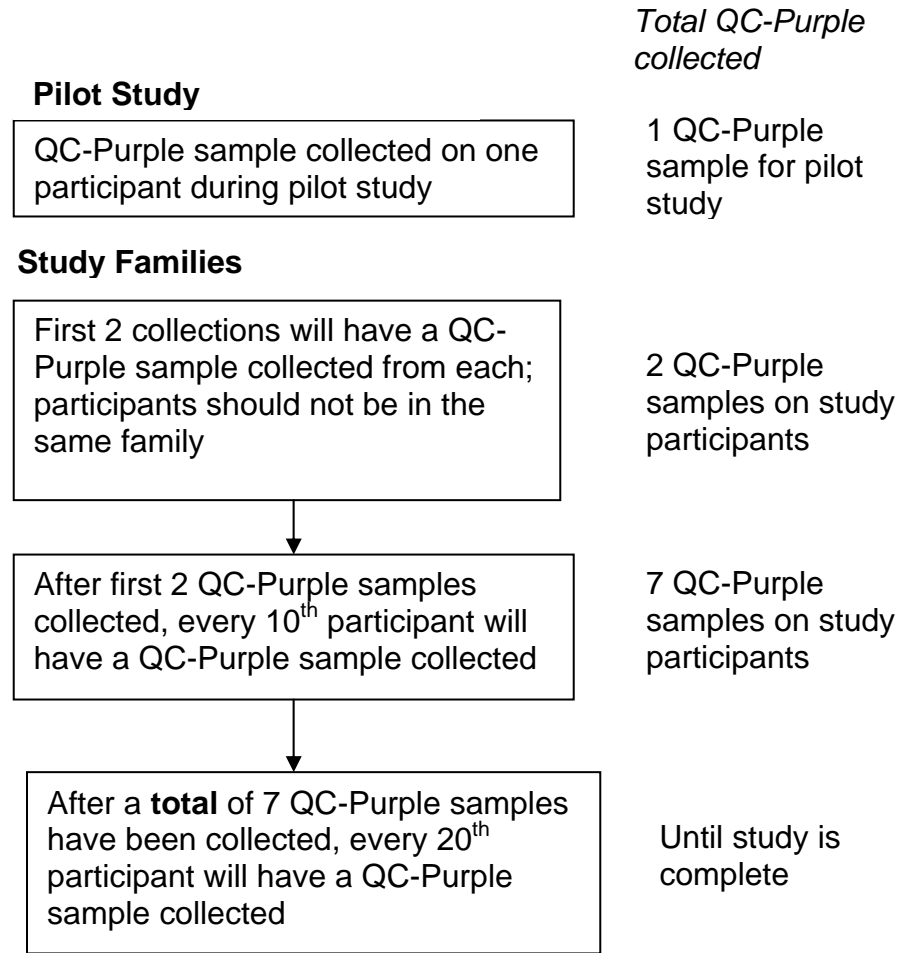

**DUPLICATE BLOOD COLLECTION SAMPLING SCHEME
AND CONTENTS OF BLOOD COLLECTION
QUALITY CONTROL LABEL SETS**

Duplicate Blood Collection Sampling Scheme

Quality Control – Red (Serum):
Age-or Size-Eligible Affected Participants

Quality Control – Purple (Plasma and Cell Pack):
Age-or Size-Eligible Participants

Note: All QC participants must be age- or size-eligible.

CONTENTS OF BLOOD COLLECTION QUALITY CONTROL LABEL SETS

ASP AND TRIO FAMILIES

QC-Red (Proband/Affected Sibling ONLY)

Large ID Labels

3 for proband (purple–striped)

3 for affected sibling (green–striped)

(1 label for blood tube, 1 for blood collection form and 1 for shipping form)

Small ID Labels

6 for proband (purple–striped)

6 for affected (green–striped)

(1 label for autoantibodies, 4 for storage and 1 for top of storage box)

QC-Purple (Any family member)

Large ID Labels

6 for every family member

(2 labels for blood tube, 1 for blood collection form and 2 for shipping forms)

Small ID Labels

5 for every family member

(4 for storage and 1 for top of storage box)

CASE-CONTROL COLLECTION

QC-Red (Case ONLY)

Large ID Labels

3 for case (orange–striped)

(1 label for blood tube, 1 for blood collection form and 1 for shipping form)

Small ID Labels

6 for case (orange–striped)

(1 label for autoantibodies, 4 for storage and 1 for top of storage box)

QC-Purple (Control ONLY)

Large ID Labels

6 for control (gray–striped)

(2 labels for blood tube, 1 for blood collection form and 2 for shipping forms)

Small ID Labels

5 for control (gray–striped)

(4 for storage and 1 for top of storage box)
